

# The package **piton**<sup>\*</sup>

F. Pantigny  
[fpantigny@wanadoo.fr](mailto:fpantigny@wanadoo.fr)

October 4, 2025

## Abstract

This document is the documented code of the LuaLaTeX package **piton**. It is *not* its user's guide. The guide of utilisation is the document **piton.pdf** (with a French translation: **piton-french.pdf**).

The development of the extension **piton** is done on the following GitHub depot:  
<https://github.com/fpantigny/piton>

## 1 Introduction

The main job of the package **piton** is to take in as input a computer listing and to send back to LaTeX as output that code *with interlaced LaTeX instructions of formatting*.

In fact, all that job is done by a LPEG called **LPEG1[<language>]** where <language> is a Lua string which is the name of the computer language. That LPEG, when matched against the string of a computer listing, returns as capture a Lua table containing data to send to LaTeX. The only thing to do after will be to apply **tex.tprint** to each element of that table.<sup>1</sup>

In fact, there is a variant of the LPEG **LPEG1[<language>]**, called **LPEG2[<language>]**. The latter uses the first one and will be used to format the whole content of an environment **{Piton}** (with, in particular, small tuning for the beginning and the end).

Consider, for example, the following Python code:

```
def parity(x):
    return x%2
```

The capture returned by the LPEG **LPEG1['python']** (in Lua, this may also be written **LPEG1.python**) against that code is the Lua table containing the following elements :

---

<sup>\*</sup>This document corresponds to the version 4.9 of **piton**, at the date of 2025/10/04.

<sup>1</sup>Recall that **tex.tprint** takes in as argument a Lua table whose first component is a “catcode table” and the second element a string. The string will be sent to LaTeX with the regime of catcodes specified by the catcode table. If no catcode table is provided, the standard catcodes of LaTeX will be used.

```

{ "\_\_piton\_begin\_line:" }a
{ {\PitonStyle{Keyword}{}} }b
{ luatexbase.catcodetables.otherc, "def" }
{ "}" }
{ luatexbase.catcodetables.other, " " }
{ {\PitonStyle{Name.Function}{}} }
{ luatexbase.catcodetables.other, "parity" }
{ "}" }
{ luatexbase.catcodetables.other, "(" }
{ luatexbase.catcodetables.other, "x" }
{ luatexbase.catcodetables.other, ")" }
{ luatexbase.catcodetables.other, ":" }
{ "\_\_piton_end_line: \_\_piton_par: \_\_piton_begin_line:" }
{ luatexbase.catcodetables.other, " " }
{ {\PitonStyle{Keyword}{}} }
{ luatexbase.catcodetables.other, "return" }
{ "}" }
{ luatexbase.catcodetables.other, " " }
{ luatexbase.catcodetables.other, "x" }
{ {\PitonStyle{Operator}{}} }
{ luatexbase.catcodetables.other, "%" }
{ "}" }
{ {\PitonStyle{Number}{}} }
{ luatexbase.catcodetables.other, "2" }
{ "}" }
{ "\_\_piton_end_line:" }

```

<sup>a</sup>Each line of the computer listings will be encapsulated in a pair: `\_\_begin\_line:` – `\_\_end\_line:`. The token `\_\_end\_line:` must be explicit because it will be used as marker in order to delimit the argument of the command `\_\_begin\_line:`. Both tokens `\_\_begin\_line:` and `\_\_end\_line:` will be nullified in the command `\piton` (since there can't be lines breaks in the argument of a command `\piton`).

<sup>b</sup>The lexical elements for which we have a piton style will be formatted via the use of the command `\PitonStyle`. Such an element is typeset in LaTeX via the syntax `{\PitonStyle{style}{...}}` because the instructions inside an `\PitonStyle` may be both semi-global declarations like `\bfseries` and commands with one argument like `\fbox`.

<sup>c</sup>`luatexbase.catcodetables.other` is a mere number which corresponds to the “catcode table” whose all characters have the catcode “other” (which means that they will be typeset by LaTeX verbatim).

We give now the LaTeX code which is sent back by Lua to TeX (we have written on several lines for legibility but no character `\r` will be sent to LaTeX). The characters which are greyed-out are sent to LaTeX with the catcode “other” (=12). All the others characters are sent with the regime of catcodes of L3 (as set by `\ExplSyntaxOn`).

```

\_\_piton_begin_line:{\PitonStyle{Keyword}{def}}
\_\_piton_end_line:{\PitonStyle{Name.Function}{parity}}(x):\_\_piton_end_line:\_\_piton_par:
\_\_piton_begin_line: \_\_piton_end_line:{\PitonStyle{Keyword}{return}}
\_\_piton_end_line:{\PitonStyle{Operator}{%}}{\PitonStyle{Number}{2}}\_\_piton_end_line:

```

## 2 The L3 part of the implementation

### 2.0.1 Declaration of the package

```

1  (*STY)
2  \NeedsTeXFormat{LaTeX2e}
3  \ProvidesExplPackage
4    {piton}
5    {\PitonFileVersion}
6    {\PitonFileVersion}
7    {Highlight computer listings with LPEG on LuaLaTeX}
8  \msg_new:nnn { piton } { latex-too-old }
9  {
10    Your~\LaTeX~release~is~too~old. \\

```

```

11 You~need~at~least~the~version~of~2025-06-01. \\%
12 If~you~use~Overleaf,~you~need~at~least~"TeXLive~2025".\\%
13 The~package~'piton'~won't~be~loaded.
14 }
15 \providecommand {\IfFormatAtLeastTF} {\@ifl@t@r \fmtversion }
16 \IfFormatAtLeastTF
17 { 2025-06-01 }
18 { }
19 { \msg_critical:nn { piton } { latex-too-old } }

```

The command `\text` provided by the package `amstext` will be used to allow the use of the command `\piton{...}` (with the standard syntax) in mathematical mode.

```
20 \RequirePackage { amstext }
```

The package `transparent` is compatible with `pdfmanagement` (which is not loaded by `piton` but which is used for the key `join` when it is loaded).

```
21 \RequirePackage { transparent }
```

```

22 \cs_new_protected:Npn \@@_error:n { \msg_error:nn { piton } }
23 \cs_new_protected:Npn \@@_warning:n { \msg_warning:nn { piton } }
24 \cs_new_protected:Npn \@@_warning:nn { \msg_warning:nnn { piton } }
25 \cs_new_protected:Npn \@@_error:nn { \msg_error:nnn { piton } }
26 \cs_new_protected:Npn \@@_error:nnn { \msg_error:nnnn { piton } }
27 \cs_new_protected:Npn \@@_fatal:n { \msg_fatal:nn { piton } }
28 \cs_new_protected:Npn \@@_fatal:nn { \msg_fatal:nnn { piton } }
29 \cs_new_protected:Npn \@@_msg_new:nn { \msg_new:nnn { piton } }

```

With Overleaf (and also TeXPage), by default, a document is compiled in non-stop mode. When there is an error, there is no way to the user to use the key `H` in order to have more information. That's why we decide to put that piece of information (for the messages with such information) in the main part of the message when the key `messages-for-Overleaf` is used (at load-time).

```

30 \cs_new_protected:Npn \@@_msg_new:nnn #1 #2 #3
31 {
32   \bool_if:NTF \g_@@_messages_for_Overleaf_bool
33     { \msg_new:nnn { piton } { #1 } { #2 \\ #3 } }
34     { \msg_new:nnnn { piton } { #1 } { #2 } { #3 } }
35 }

```

We also create commands which will generate usually an error but only a warning on Overleaf. The argument is given by curryfication.

```

36 \cs_new_protected:Npn \@@_error_or_warning:n
37   { \bool_if:NTF \g_@@_messages_for_Overleaf_bool \@@_warning:n \@@_error:n }
38 \cs_new_protected:Npn \@@_error_or_warning:nn
39   { \bool_if:NTF \g_@@_messages_for_Overleaf_bool \@@_warning:nn \@@_error:nn }

```

We try to detect whether the compilation is done on Overleaf. We use `\c_sys_jobname_str` because, with Overleaf, the value of `\c_sys_jobname_str` is always "output".

```

40 \bool_new:N \g_@@_messages_for_Overleaf_bool
41 \bool_gset:Nn \g_@@_messages_for_Overleaf_bool
42 {
43   \str_if_eq_p:on \c_sys_jobname_str { _region_ } % for Emacs

137 }

138 \bool_if:NT \g_@@_footnote_bool
139 {
```

The class `beamer` has its own system to extract footnotes and that's why we have nothing to do if `beamer` is used.

```
140 \IfClassLoadedTF { beamer }
141     { \bool_gset_false:N \g_@@_footnote_bool }
142     {
143         \IfPackageLoadedTF { footnotehyper }
144             { \@@_error:n { footnote~with~footnotehyper~package } }
145             { \usepackage { footnote } }
146     }
147 }

148 \bool_if:NT \g_@@_footnotehyper_bool
149 {
```

The class `beamer` has its own system to extract footnotes and that's why we have nothing to do if `beamer` is used.

```
150 \IfClassLoadedTF { beamer }
151     { \bool_gset_false:N \g_@@_footnote_bool }
152     {
153         \IfPackageLoadedTF { footnote }
```

```

154     { \@@_error:n { footnotehyper~with~footnote-package } }
155     { \usepackage { footnotehyper } }
156     \bool_gset_true:N \g_@@_footnote_bool
157   }
158 }
```

The flag `\g_@@_footnote_bool` is raised and so, we will only have to test `\g_@@_footnote_bool` in order to know if we have to insert an environment `{savenotes}`.

## 2.0.2 Parameters and technical definitions

```

159 \dim_new:N \l_@@_rounded_corners_dim
160 \bool_new:N \l_@@_in_label_bool
161 \dim_new:N \l_@@_tmpc_dim
```

The listing that we have to format will be stored in `\l_@@_listing_tl`. That applies both for the command `\PitonInputFile` and the environment `{Piton}` (or another environment defined by `\NewPitonEnvironment`).

```
162 \tl_new:N \l_@@_listing_tl
```

The content of an environment such as `{Piton}` will be composed first in the following box, but that box will (sometimes) be *unboxed* at the end.

We need a global variable (see `\@@_add_backgrounds_to_output_box:`).

```
163 \box_new:N \g_@@_output_box
```

The following string will contain the name of the computer language considered (the initial value is `python`).

```

164 \str_new:N \l_piton_language_str
165 \str_set:Nn \l_piton_language_str { python }
```

Each time an environment of piton is used, the computer listing in the body of that environment will be stored in the following global string.

```
166 \tl_new:N \g_piton_last_code_tl
```

The following parameter corresponds to the key `path` (which is the path used to include files by `\PitonInputFile`). Each component of that sequence will be a string (type `str`).

```
167 \seq_new:N \l_@@_path_seq
```

The names of all the join files will be stored in the following sequence:

```
168 \seq_new:N \g_@@_join_seq
```

The following parameter corresponds to the key `path-write` (which is the path used when writing files from listings inserted in the environments of piton by use of the key `write`).

```
169 \str_new:N \l_@@_path_write_str
```

The following parameter corresponds to the key `tcolorbox`.

```
170 \bool_new:N \l_@@_tcolorbox_bool
```

When the key `tcolorbox` is used, you will have to take into account the width of the graphical elements added by `tcolorbox` on both sides of the listing. We will put that quantity in the following variable.

```
171 \dim_new:N \l_@@_ tcb_margins_dim
```

The following parameter corresponds to the key `box`.

```
172 \str_new:N \l_@@_box_str
```

In order to have a better control over the keys.

```

173 \bool_new:N \l_@@_in_PitonOptions_bool
174 \bool_new:N \l_@@_in_PitonInputFile_bool
```

The following parameter corresponds to the key `font-command`.

```

175 \tl_new:N \l_@@_font_command_tl
176 \tl_set:Nn \l_@@_font_command_tl { \ttfamily }
```

We will compute (with Lua) the numbers of lines of the listings (or *chunks* of listings when `split-on-empty-lines` is in force) and store it in the following counter.

```
177 \int_new:N \g_@@_nb_lines_int
```

The same for the number of non-empty lines of the listings.

```
178 \int_new:N \l_@@_nb_non_empty_lines_int
```

The following counter will be used to count the lines during the composition. It will take into account all the lines, empty or not empty. It won't be used to print the numbers of the lines but will be used to allow or disallow line breaks (when `splittable` is in force) and for the color of the background (when `background-color` is used with a *list* of colors or when `\rowcolor` is used).

```
179 \int_new:N \g_@@_line_int
```

The following counter corresponds to the key `splittable` of `\PitonOptions`. If the value of `\l_@@_splittable_int` is equal to *n*, then no line break can occur within the first *n* lines or the last *n* lines of a listing (or a *chunk* of listings when the key `split-on-empty-lines` is in force).

```
180 \int_new:N \l_@@_splittable_int
```

An initial value of `splittable` equal to 100 is equivalent to say that the environments `{Piton}` are unbreakable.

```
181 \int_set:Nn \l_@@_splittable_int { 100 }
```

When the key `split-on-empty-lines` will be in force, then the following token list will be inserted between the chunks of code (the computer listing provided by the end user is split in chunks on the empty lines in the code).

```
182 \tl_new:N \l_@@_split_separation_tl
183 \tl_set:Nn \l_@@_split_separation_tl
184 { \vspace { \baselineskip } \vspace { -1.25pt } }
```

That parameter must contain elements to be inserted in *vertical* mode by TeX.

The following string corresponds to the key `background-color` of `\PitonOptions`.

```
185 \clist_new:N \l_@@_bg_color_clist
```

We will also keep in memory the length of the previous `clist` (for efficiency).

```
186 \int_new:N \l_@@_bg_colors_int
```

The package `piton` will also detect the lines of code which correspond to the user input in a Python console, that is to say the lines of code beginning with `>>>` and `....`. It's possible, with the key `prompt-background-color`, to require a background for these lines of code (and the other lines of code will have the standard background color specified by `background-color`).

```
187 \tl_new:N \l_@@_prompt_bg_color_tl
188 \tl_set:Nn \l_@@_prompt_bg_color_tl { gray!15 }
189 \tl_new:N \l_@@_space_in_string_tl
```

The following parameters correspond to the keys `begin-range` and `end-range` of the command `\PitonInputFile`.

```
190 \str_new:N \l_@@_begin_range_str
191 \str_new:N \l_@@_end_range_str
```

The following boolean corresponds to the key `math-comments` (available only in the preamble of the LaTeX document).

```
192 \bool_new:N \g_@@_math_comments_bool
```

The argument of `\PitonInputFile`.

```
193 \str_new:N \l_@@_file_name_str
```

The following flag corresponds to the key `print`. The initial value of that parameter will be `true` (and not `false`) since, of course, by default, we want to print the content of the environment `{Piton}`

```
194 \bool_new:N \l_@@_print_bool
195 \bool_set_true:N \l_@@_print_bool
```

The parameter `\l_@@_write_str` corresponds to the key `write`.

```
196 \str_new:N \l_@@_write_str
```

The parameter `\l_@@_join_str` corresponds to the key `join`.

```
197 \str_new:N \l_@@_join_str
```

The following boolean corresponds to the keys `paperclip` and `annotation`.

```
198 \bool_new:N \l_@@_paperclip_bool  
199 \str_new:N \l_@@_paperclip_str  
200 \bool_new:N \l_@@_annotation_bool
```

The listings embedded in the PDF by the key `paperclip` will be numbered by the following counter.

```
201 \int_new:N \g_@@_paperclip_int
```

The following boolean corresponds to the key `show-spaces`.

```
202 \bool_new:N \l_@@_show_spaces_bool
```

The following booleans correspond to the keys `break-lines` and `indent-broken-lines`.

```
203 \bool_new:N \l_@@_break_lines_in_Piton_bool  
204 \bool_set_true:N \l_@@_break_lines_in_Piton_bool  
205 \bool_new:N \l_@@_indent_broken_lines_bool
```

The following token list corresponds to the key `continuation-symbol`.

```
206 \tl_new:N \l_@@_continuation_symbol_tl  
207 \tl_set:Nn \l_@@_continuation_symbol_tl { + }
```

The following token list corresponds to the key `continuation-symbol-on-indentation`. The name has been shorten to `csoi`.

```
208 \tl_new:N \l_@@_csoi_tl  
209 \tl_set:Nn \l_@@_csoi_tl { $ \hookrightarrow \; $ }
```

The following token list corresponds to the key `end-of-broken-line`.

```
210 \tl_new:N \l_@@_end_of_broken_line_tl  
211 \tl_set:Nn \l_@@_end_of_broken_line_tl { \hspace*{0.5em} \textbackslash }
```

The following boolean corresponds to the key `break-lines-in-piton`.

```
212 \bool_new:N \l_@@_break_lines_in_piton_bool
```

The following flag will be raised when the key `max-width` is used (and when `width` is used with the key `min`, which is equivalent to `max-width=\ linewidth`). Note also that the key `box` sets `width=min` (except if `min` is used with a numerical value).

```
213 \bool_new:N \l_@@_minimize_width_bool
```

The following dimension corresponds to the key `width`. It's meant to be the whole width of the environment (for instance, the width of the box of `tcolorbox` when the key `tcolorbox` is used). The initial value is 0 pt which means that the end user has not used the key. In that case, it will be set equal to the current value of `\ linewidth` in `\@@_pre_composition:`.

However if `max-width` is used (or `width=min` which is equivalent to `max-width=\ linewidth`), the actual width of the final environment in the PDF may (potentially) be smaller.

```
214 \dim_new:N \l_@@_width_dim
```

`\l_@@_listing_width_dim` will be the width of the listing taking into account the lines of code (of course) but also:

- `\l_@@_left_margin_dim` (for the numbers of lines);
- a small margin when `background-color` is in force<sup>2</sup>).

```
215 \dim_new:N \l_@@_listing_width_dim
```

However, if `max-width` is used (or `width=min` which is equivalent to `max-width=\ linewidth`), that length will be computed once again in `\@@_create_output_box`:

`\l_@@_code_width_dim` will be the length of the lines of code, without the potential margins (for the backgrounds and for `length-margin` for the number of lines).

It will be computed in `\@@_compute_code_width`:

```
216 \dim_new:N \l_@@_code_width_dim
```

---

<sup>2</sup>Remark that the mere use of `\rowcolor` does not add those small margins.

```
217 \box_new:N \l_@@_line_box
```

The following dimension corresponds to the key `left-margin`.

```
218 \dim_new:N \l_@@_left_margin_dim
```

The following boolean will be set when the key `left-margin=auto` is used.

```
219 \bool_new:N \l_@@_left_margin_auto_bool
```

The following dimension corresponds to the key `numbers-sep` of `\PitonOptions`.

```
220 \dim_new:N \l_@@_numbers_sep_dim
```

```
221 \dim_set:Nn \l_@@_numbers_sep_dim { 0.7 em }
```

Be careful. The following sequence `\g_@@_languages_seq` is not the list of the languages supported by piton. It's the list of the languages for which at least a user function has been defined. We need that sequence only for the command `\PitonClearUserFunctions` when it is used without its optional argument: it must clear the whole list of languages for which at least a user function has been defined.

```
222 \seq_new:N \g_@@_languages_seq
```

```
223 \int_new:N \l_@@_tab_size_int
```

```
224 \int_set:Nn \l_@@_tab_size_int { 4 }
```

```
225 \cs_new_protected:Npn \@@_tab:
```

```
226 {
```

```
227 \bool_if:NTF \l_@@_show_spaces_bool
```

```
228 {
```

```
229 \hbox_set:Nn \l_tmpa_box
```

```
230 { \prg_replicate:nn \l_@@_tab_size_int { ~ } }
```

```
231 \dim_set:Nn \l_tmpa_dim { \box_wd:N \l_tmpa_box }
```

```
232 \color{gray}
```

```
233 { \hbox_to_wd:nn \l_tmpa_dim { \rightarrowfill } }
```

```
234 }
```

```
235 { \hbox:n { \prg_replicate:nn \l_@@_tab_size_int { ~ } }
```

```
236 \int_gadd:Nn \g_@@_indentation_int \l_@@_tab_size_int
```

```
237 }
```

The following integer corresponds to the key `gobble`.

```
238 \int_new:N \l_@@_gobble_int
```

The following token list will be used only for the spaces in the strings.

```
239 \tl_set_eq:NN \l_@@_space_in_string_tl \nobreakspace
```

When the key `break-lines-in-piton` is set, that parameter will be replaced by `\space` (in `\piton` with the standard syntax) and when the key `show-spaces-in-strings` is set, it will be replaced by `\u2423` (U+2423).

At each line, the following counter will count the spaces at the beginning.

```
240 \int_new:N \g_@@_indentation_int
```

In the environment `{Piton}`, the command `\label` will be linked to the following command.

```
241 \cs_new_protected:Npn \@@_label:n #1
```

```
242 {
```

```
243 \bool_if:NTF \l_@@_line_numbers_bool
```

```
244 {
```

```
245 \@bsphack
```

```
246 \protected@write \auxout { }
```

```
247 {
```

```
248 \string \newlabel { #1 }
```

```
249 {
```

```
250 { \int_use:N \g_@@_visual_line_int }
```

```
251 { \thepage }
```

```
252 { }
```

```
253 { line.#1 }
```

```
254 { }
```

```

255         }
256     }
257     \@esphack
258     \IfPackageLoadedT { hyperref }
259     { \Hy@raisedlink { \hyper@anchorstart { line.#1 } \hyper@anchorend } }
260   }
261   { \@@_error:n { label-with-lines-numbers } }
262 }

```

The same goes for the command `\zlabel` if the `zref` package is loaded. Note that `\label` will also be linked to `\@@_zlabel:n` if the key `label-as-zlabel` is set to `true`.

```

263 \cs_new_protected:Npn \@@_zlabel:n #1
264 {
265   \bool_if:NTF \l_@@_line_numbers_bool
266   {
267     \@bsphack
268     \protected@write \auxout { }
269   {
270     \string \zref@newlabel { #1 }
271   {
272     \string \default { \int_use:N \g_@@_visual_line_int }
273     \string \page { \thepage }
274     \string \zc@type { line }
275     \string \anchor { line.#1 }
276   }
277   }
278   \@esphack
279   \IfPackageLoadedT { hyperref }
280   { \Hy@raisedlink { \hyper@anchorstart { line.#1 } \hyper@anchorend } }
281 }
282 { \@@_error:n { label-with-lines-numbers } }
283 }

```

In the environments `{Piton}` the command `\rowcolor` will be linked to the following one.

```

284 \NewDocumentCommand { \@@_rowcolor:n } { o m }
285 {
286   \tl_gset:ce
287   { \g_@@_color_ \int_eval:n { \g_@@_line_int + 1 }_ \tl }
288   { \tl_if_novalue:nTF { #1 } { #2 } { [ #1 ] { #2 } } }
289   \bool_gset_true:N \g_@@_rowcolor_inside_bool
290 }

```

In the command `piton` (in fact in `\@@_piton_standard` and `\@@_piton_verbatim`, the command `\rowcolor` will be linked to the following one (in order to nullify its effect).

```
291 \NewDocumentCommand { \@@_noop_rowcolor } { o m } { }
```

The following commands correspond to the keys `marker/beginning` and `marker/end`. The values of that keys are functions that will be applied to the “*range*” specified by the end user in an individual `\PitonInputFile`. They will construct the markers used to find textually in the external file loaded by `piton` the part which must be included (and formatted).

These macros must *not* be protected.

```

292 \cs_new:Npn \@@_marker_beginning:n #1 { }
293 \cs_new:Npn \@@_marker_end:n #1 { }
```

The following token list will be evaluated at the end of `\@@_begin_line:...` `\@@_end_line:` and cleared at the end. It will be used by LPEG acting between the lines of the Python code in order to add instructions to be executed in vertical mode between the lines.

```
294 \tl_new:N \g_@@_after_line_tl
```

The spaces at the end of a line of code are deleted by `piton`. However, it's not actually true: they are replaced by `\@_trailing_space`:

```
295 \cs_new_protected:Npn \@_trailing_space: { }
```

When we have to rescan some pieces of code, we will use `\@_piton:n` and that command `\@_piton:n` will set `\@_trailing_space:` equal to `\space`.

```
296 \bool_new:N \g_@@_color_is_none_bool
297 \bool_new:N \g_@@_next_color_is_none_bool

298 \bool_new:N \g_@@_rowcolor_inside_bool
```

### 2.0.3 Detected commands

There are four keys for “detected commands and environments”: `detected-commands`, `raw-detected-commands`, `beamer-commands` and `beamer-environments`.

In fact, there is also `vertical-detected-commands` but has a special treatment.

For each of those keys, we keep aclist of the names of such detected commands and environments. For the commands, the corresponding `clist` will contain the name of the commands *without* the backlash.

```
299 \clist_new:N \l_@@_detected_commands_clist
300 \clist_new:N \l_@@_raw_detected_commands_clist
301 \clist_new:N \l_@@_beamer_commands_clist
302 \clist_set:Nn \l_@@_beamer_commands_clist
303   { uncover, only , visible , invisible , alert , action}
304 \clist_new:N \l_@@_beamer_environments_clist
305 \clist_set:Nn \l_@@_beamer_environments_clist
306   { uncoverenv , onlyenv , visibleenv , invisibleenv , alertenv , actionenv }
```

Remark that, since we have used clists, these clists, as token lists are “purified”: there is no empty component and for each component, there is no space on both sides.

Of course, the value of those clists may be modified during the preamble of the document by using the corresponding key (`detected-commands`, etc.).

However, after the `\begin{document}`, it's no longer possible to modify those clists because their contents will be used in the construction of the main LPEG for each computer language.

However, in a `\AtBeginDocument`, we will convert those clists into “toks registers” of TeX.

```
307 \hook_gput_code:nnn { begindocument } { . }
308 {
309   \newtoks \PitonDetectedCommands
310   \newtoks \PitonRawDetectedCommands
311   \newtoks \PitonBeamerCommands
312   \newtoks \PitonBeamerEnvironments
```

L3 does *not* support those “toks registers” but it's still possible to affect to the “toks registers” the content of the clists with a L3-like syntax.

```
313 \exp_args:NV \PitonDetectedCommands \l_@@_detected_commands_clist
314 \exp_args:NV \PitonRawDetectedCommands \l_@@_raw_detected_commands_clist
315 \exp_args:NV \PitonBeamerCommands \l_@@_beamer_commands_clist
316 \exp_args:NV \PitonBeamerEnvironments \l_@@_beamer_environments_clist
317 }
```

Then at the beginning of the document, when we will load the Lua file `piton.lua`, we will read those “toks registers” within Lua (with `tex.toks`) and convert them into Lua tables (and, then, use those tables to construct LPEG).

When the key `vertical-detected-commands` is used, we will have to redefine the corresponding commands in `\@_pre_composition:`.

The instructions for these redefinitions will be put in the following token list.

```
318 \tl_new:N \g_@@_def_vertical_commands_tl
```

```

319 \cs_new_protected:Npn \@@_vertical_commands:n #1
320 {
321   \clist_put_right:Nn \l_@@_raw_detected_commands_clist { #1 }
322   \clist_map_inline:nn { #1 }
323   {
324     \cs_set_eq:cc { @@ _ old _ ##1 : } { ##1 }
325     \cs_new_protected:cn { @@ _ new _ ##1 : n }
326     {

328         { \l_@@_tcolorbox_bool || ! \str_if_empty_p:N \l_@@_box_str }
329         {
330           \tl_gput_right:Nn \g_@@_after_line_tl
331             { \use:c { @@ _old _ ##1 : } { #####1 } }
332         }
333         {
334           \cs_if_exist:cTF { g_@@_after_line _ \int_use:N \g_@@_line_int _ tl }
335             { \tl_gput_right:cn }
336             { \tl_gset:cn }
337             { g_@@_after_line _ \int_eval:n { \g_@@_line_int + 1 } _ tl }
338             { \use:c { @@ _old _ ##1 : } { #####1 } }
339         }
340       }
341     \tl_gput_right:Nn \g_@@_def_vertical_commands_tl
342       { \cs_set_eq:cc { ##1 } { @@ _ new _ ##1 : n } }
343   }
344 }
```

#### 2.0.4 Treatment of a line of code

```

345 \cs_new_protected:Npn \@@_replace_spaces:n #1
346 {
347   \tl_set:Nn \l_tmpa_tl { #1 }
348   \bool_if:NTF \l_@@_show_spaces_bool
349   {
350     \tl_set:Nn \l_@@_space_in_string_tl { \u{20} } % U+2423
351     \tl_replace_all:NVn \l_tmpa_tl \c_catcode_other_space_tl { \u{20} } % U+2423
352   }
353 }
```

If the key `break-lines-in-Piton` is in force, we replace all the characters U+0020 (that is to say the spaces) by `\@@_breakable_space:`. Remark that, except the spaces inserted in the LaTeX comments (and maybe in the math comments), all these spaces are of catcode “other” (=12) and are unbreakable.

```

354   \bool_if:NT \l_@@_break_lines_in_Piton_bool
355   {
356     \tl_if_eq:NnF \l_@@_space_in_string_tl { \u{20} }
357       { \tl_set_eq:NN \l_@@_space_in_string_tl \@@_breakable_space: }
```

In the following code, we have to replace all the spaces in the token list `\l_tmpa_tl`. That means that this replacement must be “recursive”: even the spaces which are within brace groups (`{...}`) must be replaced. For instance, the spaces in long strings of Python are within such groups since there are within a command `\PitonStyle{String.Long}{...}`. That’s why the use of `\tl_replace_all:Nnn` is not enough.

The first implementation was using `\tl_regex_replace_all:nnN`  
`\tl_regex_replace_all:nnN { \x20 } { \c { @@_breakable_space: } } \l_tmpa_tl`  
but that programming was certainly slow.

Now, we use `\tl_replace_all:NVn` but, in the styles `String.Long.Internal` we replace the spaces with `\@@_breakable_space:` by another use of the same technic with `\tl_replace_all:NVn`. We do the same job for the *doc strings* of Python and for the comments.

```

358   \tl_replace_all:NVn \l_tmpa_tl
359     \c_catcode_other_space_tl
360     \@@_breakable_space:
```

```

361         }
362     }
363     \l_tmpa_tl
364 }
365 \cs_generate_variant:Nn \@@_replace_spaces:n { o }

```

In the contents provided by Lua, each line of the Python code will be surrounded by `\@@_begin_line:` and `\@@_end_line:`.

`\@@_begin_line:` is a TeX command with a delimited argument (`\@@_end_line:` is the marker for the end of the argument).

However, we define also `\@@_end_line:` as no-op, because, when the last line of the listing is the end of an environment of Beamer (eg `\end{uncoverenv}`), we will have a token `\@@_end_line:` added at the end without any corresponding `\@@_begin_line:`).

```
366 \cs_set_protected:Npn \@@_end_line: { }
```

```

367 \cs_set_protected:Npn \@@_begin_line: #1 \@@_end_line:
368 {
369     \group_begin:
370     \int_gzero:N \g_@@_indentation_int

```

We put the potential number of line, the potential left and right margins.

```

371     \hbox_set:Nn \l_@@_line_box
372     {
373         \skip_horizontal:N \l_@@_left_margin_dim
374         \bool_if:NT \l_@@_line_numbers_bool
375         {

```

`\l_tmpa_int` will be equal to 1 when the current line is not empty.

```

376     \int_set:Nn \l_tmpa_int
377     {
378         \lua_now:e
379         {
380             tex.sprint
381             (

```

The following expression gives a integer of Lua (`integer` is a sub-type of `number` introduced in Lua 5.3), the output will be of the form "3" (and not "3.0") which is what we want for `\int_set:Nn`.

```

382         piton.empty_lines
383             [ \int_eval:n { \g_@@_line_int + 1 } ]
384             )
385             }
386             }
387             \bool_lazy_or:nnT
388                 { \int_compare_p:nNn \l_tmpa_int = \c_one_int }
389                 { ! \l_@@_skip_empty_lines_bool }
390                 { \int_gincr:N \g_@@_visual_line_int }
391             \bool_lazy_or:nnT
392                 { \int_compare_p:nNn \l_tmpa_int = \c_one_int }
393                 { ! \l_@@_skip_empty_lines_bool && \l_@@_label_empty_lines_bool }
394                 { \@@_print_number: }
395             }

```

If there is a background, we must remind that there is a left margin of 0.5 em for the background (which will be added later).

```
396     \int_compare:nNnT \l_@@_bg_colors_int > { \c_zero_int }
```

```
397     {
```

... but if only if the key `left-margin` is not used !

```
398         \dim_compare:nNnT \l_@@_left_margin_dim = \c_zero_dim
399             { \skip_horizontal:n { 0.5 em } }
400             }
```

```
401     \bool_if:NTF \l_@@_minimize_width_bool
402     {
```

```

403          \hbox_set:Nn \l_tmpa_box
404          {
405              \language = -1
406              \raggedright
407              \strut
408              \@@_replace_spaces:n { #1 }
409              \strut \hfil
410          }
411          \dim_compare:nNnTF { \box_wd:N \l_tmpa_box } < \l_@@_code_width_dim
412              { \box_use:N \l_tmpa_box }
413              { \@@_vtop_of_code:n { #1 } }
414          }
415          { \@@_vtop_of_code:n { #1 } }
416      }

```

Now, the line of code is composed in the box `\l_@@_line_box`.

```

417          \box_set_dp:Nn \l_@@_line_box { \box_dp:N \l_@@_line_box + 1.25 pt }
418          \box_set_ht:Nn \l_@@_line_box { \box_ht:N \l_@@_line_box + 1.25 pt }
419          \box_use_drop:N \l_@@_line_box
420
421          \group_end:
422          \g_@@_after_line_tl
423          \tl_gclear:N \g_@@_after_line_tl
424      }

```

The following command will be used in `\@@_begin_line: ... \@@_end_line::`.

```

424  \cs_new_protected:Npn \@@_vtop_of_code:n #1
425  {
426      \vbox_top:n
427      {
428          \hsize = \l_@@_code_width_dim
429          \language = -1
430          \raggedright
431          \strut
432          \@@_replace_spaces:n { #1 }
433          \strut \hfil
434      }
435  }

```

Of course, the following command will be used when the key `background-color` is used.  
The content of the line has been previously set in `\l_@@_line_box`.

That command is used only once, in `\@@_add_backgrounds_to_output_box::`.

```

436  \cs_new_protected:Npn \@@_add_background_to_line_and_use:
437  {
438      \vtop
439      {
440          \offinterlineskip
441          \hbox
442          {

```

The command `\@@_compute_and_set_color:` sets the current color but also sets the booleans `\g_@@_color_is_none_bool` and `\g_@@_next_color_is_none_bool`. It uses the current value of `\l_@@_bg_color_clist`, the value of `\g_@@_line_int` (the number of the current line) but also potential token lists of the form `\g_@@_color_12_tl` if the end user has used the command `\rowcolor`.

```
443          \@@_compute_and_set_color:
```

The colored panels are overlapping. However, if the special color `none` is used we must not put such overlapping.

```

444          \dim_set:Nn \l_tmpa_dim { \box_dp:N \l_@@_line_box }
445          \bool_if:NT \g_@@_next_color_is_none_bool
446              { \dim_sub:Nn \l_tmpa_dim { 2.5 pt } }

```

When `\g_@@_color_is_none_bool` is in force, we will compose a `\vrule` of width 0 pt. We need that `\vrule` because it will be a strut.

```

447         \bool_if:NTF \g_@@_color_is_none_bool
448             { \dim_zero:N \l_tmpb_dim }
449             { \dim_set_eq:NN \l_tmpb_dim \l_@@_listing_width_dim }
450             \dim_set:Nn \l_@@_tmpc_dim { \box_ht:N \l_@@_line_box }

```

Now, the colored panel.

```

451     \dim_compare:nNnTF \l_@@_rounded_corners_dim > \c_zero_dim
452     {
453         \int_compare:nNnTF \g_@@_line_int = \c_one_int
454         {
455             \begin{tikzpicture}[baseline = 0cm]

494 }

```

End of `\@@_add_background_to_line_and_use`:

The command `\@@_compute_and_set_color`: sets the current color but also sets the booleans `\g_@@_color_is_none_bool` and `\g_@@_next_color_is_none_bool`. It uses the current value of `\l_@@_bg_color_clist`, the value of `\g_@@_line_int` (the number of the current line) but also potential token lists of the form `\g_@@_color_12_tl` if the end user has used the command `\rowcolor`.

```

496 \cs_set_protected:Npn \@@_compute_and_set_color:
497 {
498     \int_compare:nNnTF \l_@@_bg_colors_int = \c_zero_int
499         { \tl_set:Nn \l_tma_tl { none } }
500         {
501             \int_set:Nn \l_tmpb_int
502                 { \int_mod:nn \g_@@_line_int \l_@@_bg_colors_int + 1 }

```

```

503     \tl_set:Nn \l_tmpa_tl { \clist_item:Nn \l_@@_bg_color_clist \l_tmpb_int }
504 }

```

The row may have a color specified by the command `\rowcolor`. We check that point now.

```

505 \cs_if_exist:cT { g_@@_color_ \int_use:N \g_@@_line_int _ tl }
506 {
507     \tl_set_eq:Nc \l_tmpa_tl { g_@@_color_ \int_use:N \g_@@_line_int _ tl }

```

We don't need any longer the variable and that's why we delete it (it must be free for the next environment of `piton`).

```

508     \cs_undefine:c { g_@@_color_ \int_use:N \g_@@_line_int _ tl }
509 }
510 \tl_if_eq:NnTF \l_tmpa_tl { none }
511 {
512     \bool_gset_true:N \g_@@_color_is_none_bool
513     \bool_gset_false:N \g_@@_color_is_none_bool
514     \color:o \l_tmpa_tl
515 }

```

We are looking for the next color because we have to know whether that color is the special color `none` (for the vertical adjustment of the background color).

```

516 \int_compare:nNnTF { \g_@@_line_int + 1 } = \g_@@_nb_lines_int
517 {
518     \bool_gset_false:N \g_@@_next_color_is_none_bool

532     {
533         \bool_gset_true:N \g_@@_next_color_is_none_bool
534         \bool_gset_false:N \g_@@_next_color_is_none_bool
535     }

```

The following command `\@@_color:n` will accept both the instruction `\@@_color:n { red!15 }` and the instruction `\@@_color:n { [rgb]{0.9,0.9,0} }`.

```

536 \cs_set_protected:Npn \@@_color:n #1
537 {
538     \tl_if_head_eq_meaning:nNTF { #1 } [
539     {
540         \tl_set:Nn \l_tmpa_tl { #1 }
541         \tl_set_rescan:Nno \l_tmpa_tl { } \l_tmpa_tl
542         \exp_last_unbraced:No \color \l_tmpa_tl
543     }
544     { \color { #1 } }
545 }
546 \cs_generate_variant:Nn \@@_color:n { o }

```

The command `\@@_par:` will be inserted by Lua between two lines of the computer listing.

- In fact, it will be inserted between two commands `\@@_begin_line:... \@@_end_of_line::`.
- When the key `break-lines-in-Piton` is in force, a line of the computer listing (the *input*) may result in several lines in the PDF (the *output*).
- Remind that `\@@_par:` has a rather complex behaviour because it will finish and start paragraphs.

```

547 \cs_new_protected:Npn \@@_par:
548 {

```

We recall that `\g_@@_line_int` is *not* used for the number of line printed in the PDF (when `line-numbers` is in force)...

```

549     \int_gincr:N \g_@@_line_int

```

... it will be used to allow or disallow page breaks, and also by the command `\rowcolor`.

Each line in the listing is composed in a box of TeX (which may contain several lines when the key `break-lines-in-Piton` is in force) put in a paragraph.

```

550     \par

```

We now add a `\kern` because each line of code is overlapping vertically by a quantity of 2.5 pt in order to have a good background (when `background-color` is in force). We need to use a `\kern` (in fact `\par\kern...`) and not a `\vskip` because page breaks should *not* be allowed on that kern.

```

551     \kern -2.5 pt

```

Now, we control page breaks after the paragraph.

```

552     \@@_add_penalty_for_the_line:
553 }

```

After the command `\@@_par:`, we will usually have a command `\@@_begin_line::`

The following command `\@@_breakable_space:` is for breakable spaces in the environments `{Piton}` and the listings of `\PitonInputFile` and *not* for the commands `\piton`.

```

554 \cs_set_protected:Npn \@@_breakable_space:
555 {
556     \discretionary
557     { \hbox:n { \color { gray } \l_@@_end_of_broken_line_tl } }

942 }

```

When using `\NewPitonEnvironment` a user may use `\PitonOptions` inside. However, the set of keys available should be different than in standard `\PitonOptions`. That's why we define a version

of `\PitonOptions` with no restriction on the set of available keys and we will link that version to `\PitonOptions` in such environment.

```
943 \NewDocumentCommand \@@_fake_PitonOptions { }
944   { \keys_set:nn { PitonOptions } }
```

## 2.0.6 The numbers of the lines

The following counter will be used to count the lines in the code when the user requires the numbers of the lines to be printed (with `line-numbers`) whereas the counter `\g_@@_line_int` previously defined is *not* used for that functionality.

```
945 \int_new:N \g_@@_visual_line_int
946 \cs_new_protected:Npn \@@_incr_visual_line:
947   {
948     \bool_if:NF \l_@@_skip_empty_lines_bool
949       { \int_gincr:N \g_@@_visual_line_int }
950   }
951 \cs_new_protected:Npn \@@_print_number:
952   {
953     \hbox_overlap_left:n
954     {
955       \l_@@_line_numbers_format_tl
956     }
```

We put braces. Thus, the user may use the key `line-numbers/format` with a value such as `\fbox`.

```
957 \pdfextension literal { /Artifact << /ActualText (\space) >> BDC }
958   { \int_to_arabic:n \g_@@_visual_line_int }
959   \pdfextension literal { EMC }
960   }
961   \skip_horizontal:N \l_@@_numbers_sep_dim
962 }
963 }
```

## 2.0.7 The main commands and environments for the end user

```
964 \NewDocumentCommand { \NewPitonLanguage } { O { } m ! o }
965   {
966     \tl_if_no_value:nTF { #3 }
```

The last argument is provided by currying.

```
967   { \@@_NewPitonLanguage:nnn { #1 } { #2 } }
```

The two last arguments are provided by currying.

```
968   { \@@_NewPitonLanguage:nnnn { #1 } { #2 } { #3 } }
969 }
```

The following property list will contain the definitions of the computer languages as provided by the end user. However, if a language is defined over another base language, the corresponding list will contain the *whole* definition of the language.

```
970 \prop_new:N \g_@@_languages_prop
```

```
971 \keys_define:nn { NewPitonLanguage }
972   {
973     morekeywords .code:n = ,
974     otherkeywords .code:n = ,
975     sensitive .code:n = ,
976     keywordsprefix .code:n = ,
977     moretexcs .code:n = ,
978     morestring .code:n = ,
979     morecomment .code:n = ,
980     moredelim .code:n = ,
```

```

981     moredirectives .code:n = ,
982     tag .code:n = ,
983     alsodigit .code:n = ,
984     alsoletter .code:n = ,
985     alsoother .code:n = ,
986     unknown .code:n = \@@_error:n { Unknown~key~NewPitonLanguage }
987 }
```

The function `\@@_NewPitonLanguage:nnn` will be used when the language is *not* defined above a base language (and a base dialect).

```

988 \cs_new_protected:Npn \@@_NewPitonLanguage:nnn #1 #2 #3
989 {
```

We store in `\l_tmpa_tl` the name of the language with the potential dialect, that is to say, for example : `[AspectJ]{Java}`. We use `\tl_if_blank:nF` because the end user may have written `\NewPitonLanguage[ ]{Java}{...}`.

```

990     \tl_set:Ne \l_tmpa_tl
991     {
992         \tl_if_blank:nF { #1 } { [ \str_lowercase:n { #1 } ] }
993         \str_lowercase:n { #2 }
994     }
```

The following set of keys is only used to raise an error when a key is unknown!

```

995     \keys_set:nn { NewPitonLanguage } { #3 }
```

We store in LaTeX the definition of the language because some languages may be defined with that language as base language.

```

996     \prop_gput:Non \g_@@_languages_prop \l_tmpa_tl { #3 }
```

The Lua part of the package `piton` will be loaded in a `\AtBeginDocument`. Hence, we will put also in a `\AtBeginDocument` the use of the Lua function `piton.new_language` (which does the main job).

```

997     \@@_NewPitonLanguage:on \l_tmpa_tl { #3 }
998 }
999 \cs_new_protected:Npn \@@_NewPitonLanguage:nn #1 #2
1000 {
1001     \hook_gput_code:nnn { begindocument } { . }
1002     { \lua_now:e { piton.new_language("#1", "\lua_escape:n{#2}") } }
1003 }
1004 \cs_generate_variant:Nn \@@_NewPitonLanguage:nn { o }
```

Now the case when the language is defined upon a base language.

```

1005 \cs_new_protected:Npn \@@_NewPitonLanguage:nnnn #1 #2 #3 #4 #5
1006 {
```

We store in `\l_tmpa_tl` the name of the base language with the dialect, that is to say, for example : `[AspectJ]{Java}`. We use `\tl_if_blank:nF` because the end user may have used `\NewPitonLanguage[Handel]{C}[ ]{C}{...}`

```

1007     \tl_set:Ne \l_tmpa_tl
1008     {
1009         \tl_if_blank:nF { #3 } { [ \str_lowercase:n { #3 } ] }
1010         \str_lowercase:n { #4 }
1011     }
```

We retrieve in `\l_tmpb_tl` the definition (as provided by the end user) of that base language. Caution: `\g_@@_languages_prop` does not contain all the languages provided by `piton` but only those defined by using `\NewPitonLanguage`.

```

1012     \prop_get:NoNTF \g_@@_languages_prop \l_tmpa_tl \l_tmpb_tl
```

We can now define the new language by using the previous function.

```

1013     { \@@_NewPitonLanguage:nnno { #1 } { #2 } { #5 } \l_tmpb_tl }
1014     { \@@_error:n { Language~not~defined } }
1015 }
```

```

1016 \cs_new_protected:Npn \@@_NewPitonLanguage:nnnn #1 #2 #3 #4
```

In the following line, we write #4, #3 and not #3, #4 because we want that the keys which correspond to base language appear before the keys which are added in the language we define.

```

1017 { \@@_NewPitonLanguage:n { #1 } { #2 } { #4 , #3 } }
1018 \cs_generate_variant:Nn \@@_NewPitonLanguage:nnnn { n n n o }

1019 \NewDocumentCommand { \piton } { }
1020 { \peek_meaning:NTF \bgroup { \@@_piton_standard } { \@@_piton_verbatim } }
1021 \NewDocumentCommand { \@@_piton_standard } { m }
1022 {
1023 \group_begin:
1024 \tl_if_eq:NnF \l_@@_space_in_string_tl { u }
1025 {

```

Remind that, when `break-strings-anywhere` is in force, multiple commands `\-` will be inserted between the characters of the string to allow the breaks. The `\exp_not:N` before `\space` is mandatory.

```

1026 \bool_lazy_or:nn
1027 \l_@@_break_lines_in_piton_bool
1028 \l_@@_break_strings_anywhere_bool
1029 { \tl_set:Nn \l_@@_space_in_string_tl { \exp_not:N \space } }
1030 }

```

The following tuning of LuaTeX in order to avoid all breaks of lines on the hyphens.

```
1031 \automatichyphenmode = 1
```

Remark that the argument of `\piton` (with the normal syntax) is expanded in the TeX sens, (see the `\tl_set:Ne` below) and that's why we can provide the following escapes to the end user:

```

1032 \cs_set_eq:NN \\ \c_backslash_str
1033 \cs_set_eq:NN \% \c_percent_str
1034 \cs_set_eq:NN \{ \c_left_brace_str
1035 \cs_set_eq:NN \} \c_right_brace_str
1036 \cs_set_eq:NN \$ \c_dollar_str

```

The standard command `\_u` is *not* expandable and we need here expandable commands. With the following code, we define an expandable command.

```

1037 \cs_set_eq:cN { ~ } \space
1038 \cs_set_eq:NN \@@_begin_line: \prg_do_nothing:

```

We redefine `\rowcolor` inside of `\piton` commands to do nothing.

```

1039 \cs_set_eq:NN \rowcolor \@@_noop_rowcolor
1040 \tl_set:Ne \l_tmpa_tl
1041 {
1042 \lua_now:e
1043 { piton.ParseBis('l_piton_language_str',token.scan_string()) }
1044 { #1 }
1045 }
1046 \bool_if:NTF \l_@@_show_spaces_bool
1047 { \tl_replace_all:Nv \l_tmpa_tl \c_catcode_other_space_tl { u } } % U+2423
1048 {
1049 \bool_if:NT \l_@@_break_lines_in_piton_bool

```

With the following line, the spaces of catacode 12 (which were not breakable) are replaced by `\space`, and, thus, become breakable.

```

1050 { \tl_replace_all:Nv \l_tmpa_tl \c_catcode_other_space_tl \space }
1051 }

```

The command `\text` is provided by the package `amstext` (loaded by `piton`).

```

1052 \if_mode_math:
1053 \text { \l_@@_font_command_tl \l_tmpa_tl }
1054 \else:
1055 \l_@@_font_command_tl \l_tmpa_tl
1056 \fi:
1057 \group_end:
1058 }

```

```

1059 \NewDocumentCommand { \@@_piton_verbatim } { v }
1060 {
1061   \group_begin:
1062   \automatichyphenmode = 1
1063   \cs_set_eq:NN \@@_begin_line: \prg_do_nothing:

```

We redefine `\rowcolor` inside of `\piton` commands to do nothing.

```

1064   \cs_set_eq:NN \rowcolor \@@_noop_rowcolor
1065   \tl_set:Nn \l_tmpa_tl
1066   {
1067     \lua_now:e
1068     { piton.Parse('l_piton_language_str',token.scan_string()) }
1069     { #1 }
1070   }
1071   \bool_if:NT \l_@@_show_spaces_bool
1072   { \tl_replace_all:Nvn \l_tmpa_tl \c_catcode_other_space_tl { \u } } % U+2423
1073   \if_mode_math:
1074     \text { \l_@@_font_command_tl \l_tmpa_tl }
1075   \else:
1076     \l_@@_font_command_tl \l_tmpa_tl
1077   \fi:
1078   \group_end:
1079 }

```

The following command does *not* correspond to a user command. It will be used when we will have to “rescan” some chunks of computer code. For example, it will be the initial value of the Piton style `InitialValues` (the default values of the arguments of a Python function).

```

1080 \cs_new_protected:Npn \@@_piton:n #
1081 { \tl_if_blank:nF { #1 } { \@@_piton_i:n { #1 } } }
1082
1083 \cs_new_protected:Npn \@@_piton_i:n #
1084 {
1085   \group_begin:
1086   \cs_set_eq:NN \@@_begin_line: \prg_do_nothing:
1087   \cs_set:cpn { pitonStyle _ \l_piton_language_str _ Prompt } { }
1088   \cs_set:cpn { pitonStyle _ Prompt } { }
1089   \cs_set_eq:NN \@@_leading_space: \space
1090   \cs_set_eq:NN \@@_trailing_space: \space
1091   \tl_set:Nn \l_tmpa_tl
1092   {
1093     \lua_now:e
1094     { piton.ParseTer('l_piton_language_str',token.scan_string()) }
1095     { #1 }
1096   }
1097   \bool_if:NT \l_@@_show_spaces_bool
1098   { \tl_replace_all:Nvn \l_tmpa_tl \c_catcode_other_space_tl { \u } } % U+2423
1099   \@@_replace_spaces:o \l_tmpa_tl
1100   \group_end:
1101 }

```

`\@@_pre_composition:` will be used both in `\PitonInputFile` and in the environments such as `{Piton}`.

```

1102 \cs_new_protected:Npn \@@_pre_composition:
1103 {
1104   \dim_compare:nNnT \l_@@_width_dim = \c_zero_dim
1105   {
1106     \dim_set_eq:NN \l_@@_width_dim \linewidth
1107     \str_if_empty:NF \l_@@_box_str

```

When the key box is used, `width=min` is activated (except when `width` has been used with a numerical value).

```

1108     { \bool_set_true:N \l_@@_minimize_width_bool }
1109 }
```

We compute `\l_@@_listing_width_dim`. However, if `max-width` is used (or `width=min` which uses `max-width`), that length will be computed again in `\@@_create_output_box`: but **even in the case**, we have to compute that value now (because the maximal width set by `max-width` may be reached by some lines of the listing—and those lines would be wrapped).

```

1110 \dim_set:Nn \l_@@_listing_width_dim
1111 {
1112     \bool_if:NTF \l_@@_tcolorbox_bool
1113     {
1114         \l_@@_width_dim -
1115         ( \kvtcb@left@rule
1116         + \kvtcb@leftupper
1117         + \kvtcb@boxsep * 2
1118         + \kvtcb@rightupper
1119         + \kvtcb@right@rule )
1120     }
1121     { \l_@@_width_dim }
1122 }
1123 \legacy_if:nT { @inlabel } { \bool_set_true:N \l_@@_in_label_bool }
1124 \automatichyphenmode = 1
1125 \bool_if:NF \l_@@_resume_bool { \int_gzero:N \g_@@_visual_line_int }
1126 \g_@@_def_vertical_commands_tl
1127 \int_gzero:N \g_@@_line_int
1128 \int_gzero:N \g_@@_nb_lines_int
1129 \dim_zero:N \parindent
1130 \dim_zero:N \lineskip
1131 \dim_zero:N \parskip
1132 \cs_set_eq:NN \rowcolor \@@_rowcolor:n
```

For efficiency, we keep in `\l_@@_bg_colors_int` the length of `\l_@@_bg_color_clist`.

```

1133 \int_compare:nNnT \l_@@_bg_colors_int > { \c_zero_int }
1134     { \bool_set_true:N \l_@@_bg_bool }
1135 \bool_gset_false:N \g_@@_rowcolor_inside_bool
1136 \IfPackageLoadedTF { zref-base }
1137     {
1138         \bool_if:NTF \g_@@_label_as_zlabel_bool
1139             { \cs_set_eq:NN \label \@@_zlabel:n }
1140             { \cs_set_eq:NN \label \@@_label:n }
1141             \cs_set_eq:NN \zlabel \@@_zlabel:n
1142         }
1143         { \cs_set_eq:NN \label \@@_label:n }
1144 \l_@@_font_command_tl
1145 }
```

If the end user has used both `left-margin=auto` and `line-numbers`, we have to compute the width of the maximal number of lines at the end of the environment to fix the correct value to `left-margin`.

```

1146 \cs_new_protected:Npn \@@_compute_left_margin:
1147 {
1148     \use:e
1149     {
1150         \bool_if:NTF \l_@@_skip_empty_lines_bool
1151             { \lua_now:n { piton.CountNonEmptyLines(token.scan_argument()) } }
1152             { \lua_now:n { piton.CountLines(token.scan_argument()) } }
1153             { \l_@@_listing_tl }
1154     }
1155     \hbox_set:Nn \l_tmpa_box
1156     {
1157         \l_@@_line_numbers_format_tl
1158         \int_to_arabic:n
1159         {
1160             \g_@@_visual_line_int
1161             +
```

```

1162         \bool_if:NTF \l_@@_skip_empty_lines_bool
1163             { \l_@@_nb_non_empty_lines_int }
1164             { \g_@@_nb_lines_int }
1165     }
1166 }
1167 \dim_set:Nn \l_@@_left_margin_dim
1168     { \box_wd:N \l_tmpa_box + \l_@@_numbers_sep_dim + 0.1 em }
1169 }
```

The following command computes `\l_@@_listing_width_dim` and it will be used when `max-width` (or `width=min`) is used. Remind that the key `box` sets `width=min` (except when `width` is used with a numerical value).

It will be used only once in `\@@_create_output_box`:

```

1170 \cs_new_protected:Npn \@@_recompute_listing_width:
1171 {
1172     \dim_set:Nn \l_@@_listing_width_dim { \box_wd:N \g_@@_output_box }
1173     \int_compare:nNnTF \l_@@_bg_colors_int > { \c_zero_int }
1174     {
1175         \dim_add:Nn \l_@@_listing_width_dim { 0.5 em }
1176         \dim_compare:nNnTF \l_@@_left_margin_dim = \c_zero_dim
1177             { \dim_add:Nn \l_@@_listing_width_dim { 0.5 em } }
1178             { \dim_add:Nn \l_@@_listing_width_dim \l_@@_left_margin_dim }
1179     }
1180     { \dim_add:Nn \l_@@_listing_width_dim \l_@@_left_margin_dim }
1181 }
```

The following command computes `\l_@@_code_width_dim`.

It will be used only once in `\@@_create_output_box`:

```

1182 \cs_new_protected:Npn \@@_compute_code_width:
1183 {
1184     \dim_set_eq:NN \l_@@_code_width_dim \l_@@_listing_width_dim
1185     \int_compare:nNnTF \l_@@_bg_colors_int > { \c_zero_int }
```

If there is a background (even a background with only the color `none`), we subtract 0.5 em for the margin on the right.

```

1186 {
1187     \dim_sub:Nn \l_@@_code_width_dim { 0.5 em }
```

And we subtract also for the left margin. If the key `left-margin` has been used (with a numerical value or with the special value `min`), `\l_@@_left_margin_dim` has a non-zero value<sup>3</sup> and we use that value. Elsewhere, we use a value of 0.5 em.

```

1188     \dim_compare:nNnTF \l_@@_left_margin_dim = \c_zero_dim
1189         { \dim_sub:Nn \l_@@_code_width_dim { 0.5 em } }
1190         { \dim_sub:Nn \l_@@_code_width_dim \l_@@_left_margin_dim }
1191 }
```

If there is no background, we only subtract the left margin.

```

1192     { \dim_sub:Nn \l_@@_code_width_dim \l_@@_left_margin_dim }
1193 }
```

```

1194 \cs_new_protected:Npn \@@_store_body:n #
1195 {
```

Now, we have to replace all the occurrences of `\obeyedline` by a character of end of line (`\r` in the strings of Lua).

```

1196     \tl_set:Ne \obeyedline { \char_generate:nn { 13 } { 11 } }
1197     \tl_set:Ne \l_@@_listing_tl { #1 }
1198     \tl_set_eq:NN \ProcessedArgument \l_@@_listing_tl
1199 }
```

The first argument of the following macro is one of the four strings: `New`, `Renew`, `Provide` and `Declare`.

---

<sup>3</sup>If the key `left-margin` has been used with the special value `min`, the actual value of `\l_@@_left_margin_dim` has yet been computed when we use the current command.

```

1325     }
1326 }
1327 }
1328 { \c@_gobble_parse_no_print:o \l_@@_listing_tl }
1329 }

```

`\c@_composition_i:` is for the main case: the key `tcolorbox` is not used, nor the key `box`.

We can't do a mere `\vbox_unpack:N \g_@@_output_box` because that would not work inside a list of LaTeX (`{itemize}` or `{enumerate}`).

The composition in the box `\g_@@_output_box` was mandatory to be able to deal with the case of a conjunction of the keys `width=min` and `background-color=....`

```

1330 \cs_new_protected:Npn \c@_composition_i:
1331 {

```

First, we “reverse” the box `\g_@@_output_box`: we put in the box `\g_tmpa_box` the boxes present in `\g_@@_output_box`, but in reversed order. The vertical spaces and the penalties are discarded.

```

1332     \box_clear:N \g_tmpa_box

```

The box `\g_@@_line_box` will be used as an auxiliary box.

```

1333     \box_clear_new:N \g_@@_line_box

```

We unpack `\g_@@_output_box` in `\l_tmpa_box` used as a scratched box.

```

1334     \vbox_set:Nn \l_tmpa_box
1335     {
1336         \vbox_unpack_drop:N \g_@@_output_box
1337         \bool_gset_false:N \g_tmpa_bool
1338         \unskip \unskip
1339         \bool_gset_false:N \g_tmpa_bool
1340         \bool_do_until:nn \g_tmpa_bool
1341         {
1342             \unskip \unskip \unskip
1343             \unpenalty \unkern
1344             \box_set_to_last:N \l_@@_line_box
1345             \box_if_empty:NTF \l_@@_line_box
1346             { \bool_gset_true:N \g_tmpa_bool }
1347             {
1348                 \vbox_gset:Nn \g_tmpa_box
1349                 {
1350                     \vbox_unpack:N \g_tmpa_box

```

```

1351           \box_use:N \l_@@_line_box
1352       }
1353   }
1354 }
1355 }
```

Now, we will loop over the boxes in `\g_tmpa_box` and compose the boxes in the TeX flow.

```

1356   \bool_gset_false:N \g_tmpa_bool
1357   \int_zero:N \g_@@_line_int
1358   \bool_do_until:nn \g_tmpa_bool
1359   {
```

We retrieve the last box of `\g_tmpa_box` (and store it in `\g_@@_line_box`) and keep the other boxes in `\g_tmpa_box`.

```

1360     \vbox_gset:Nn \g_tmpa_box
1361     {
1362         \vbox_unpack_drop:N \g_tmpa_box
1363         \box_gset_to_last:N \g_@@_line_box
1364     }
```

If the box that we have retrieved is void, that means that, in fact, there is no longer boxes in `\g_tmpa_box` and we will exit the loop.

```

1365   \box_if_empty:NTF \g_@@_line_box
1366   {
1367       \bool_gset_true:N \g_tmpa_bool
1368   }
1369   \box_use:N \g_@@_line_box
1370   \int_gincr:N \g_@@_line_int
1371   \par
1372   \kern -2.5 pt
```

We will determine the penalty by reading the Lua table `piton.lines_status`. That will use the current value of `\g_@@_line_int`.

```
1372     \@@_add_penalty_for_the_line:
```

We now add the instructions corresponding to the *vertical detected commands* that are potentially used in the corresponding line of the listing.

```

1373     \cs_if_exist_use:cT { g_@@_after_line _ \int_use:N \g_@@_line_int _ t1 }
1374     {
1375         \cs_undefine:c { g_@@_after_line _ \int_use:N \g_@@_line_int _ t1 } }
1376         \int_compare:nNnT \g_@@_line_int < \g_@@_nb_lines_int
1377         {
1378             \mode_leave_vertical:
1379         }
1380     }
```

`\@@_composition_ii:` will be used when the key `box` is in force.

```

1381 \cs_new_protected:Npn \@@_composition_ii:
1382 {
1383     \use:e { \begin{minipage} [ \l_@@_box_str ] }
1384     { \l_@@_listing_width_dim }
```

Here, `\vbox_unpack:N`, instead of `\box_use:N` is mandatory for the vertical position of the box.

```
1385     \vbox_unpack:N \g_@@_output_box
```

`\kern` is mandatory here (`\skip_vertical:n` won't work).

```

1386     \kern 2.5 pt
1387     \end{minipage}
1388 }
```

`\@@_composition_iii:` will be used when the key `tcolorbox` is in force but *not* the key `box`.

```

1389 \cs_new_protected:Npn \@@_composition_iii:
1390 {
1391     \use:e
1392     {
1393         \begin{tcolorbox}
```

Even though we use the key `breakable` of `{tcolorbox}`, our environment will be breakable only when the key `splittable` of `piton` is used.

```

1394     [ breakable , text-width = \l_@@_listing_width_dim ]
1395   }
1396   \par
1397   \vbox_unpack:N \g_@@_output_box
1398   \end { tcolorbox }
1399 }

\@@_composition_iv: will be used when both keys tcolorbox and box are in force.
1400 \cs_new_protected:Npn \@@_composition_iv:
1401 {
1402   \use:e
1403   {
1404     \begin { tcolorbox }
1405     [
1406       hbox ,
1407       text-width = \l_@@_listing_width_dim ,
1408       nobeforeafter ,
1409       box-align =
1410         \str_case:Nn \l_@@_box_str
1411         {
1412           t { top }
1413           b { bottom }
1414           c { center }
1415           m { center }
1416         }
1417     ]
1418   }
1419   \box_use:N \g_@@_output_box
1420   \end { tcolorbox }
1421 }

```

The following function will add the correct vertical penalty after a line of code in order to control the breaks of the pages. We use the Lua table `piton.lines_status` which has been written by `piton.ComputeLinesStatus` for this aim. Each line has a “status” (equal to 0, 1 or 2) and that status directly says whether a break is allowed.

```

1422 \cs_new_protected:Npn \@@_add_penalty_for_the_line:
1423 {
1424   \int_case:nn
1425   {
1426     \lua_now:e
1427     {
1428       \tex.sprint
1429       ( piton.lines_status [ \int_use:N \g_@@_line_int ] )
1430     }
1431   }
1432   { 1 { \penalty 100 } 2 \nobreak }
1433 }

```

\@@\_create\_output\_box: is used only once, in \@@\_composition:.

It creates (and modify when there are backgrounds) \g\_@@\_output\_box.

```

1434 \cs_new_protected:Npn \@@_create_output_box:
1435 {
1436   \@@_compute_code_width:
1437   \vbox_gset:Nn \g_@@_output_box
1438   { \@@_retrieve_gobble_parse:o \l_@@_listing_tl }
1439   \bool_if:NT \l_@@_minimize_width_bool { \@@_recompute_listing_width: }
1440   \bool_lazy_or:nnT
1441   { \int_compare_p:nNn \l_@@_bg_colors_int > { \c_zero_int } }
1442   { \g_@@_rowcolor_inside_bool }
1443   { \@@_add_backgrounds_to_output_box: }
1444 }

```

We add the backgrounds after the composition of the box `\g_@@_output_box` by a loop over the lines in that box. The backgrounds will have a width equal to `\l_@@_listing_width_dim`. That command will be used only once, in `\@@_create_output_box`:

```

1445 \cs_new_protected:Npn \@@_add_backgrounds_to_output_box:
1446 {
1447     \int_gset_eq:NN \g_@@_line_int \g_@@_nb_lines_int
\l_tmpa_box is only used to unpack the vertical box \g_@@_output_box.
1448     \vbox_set:Nn \l_tmpa_box
1449     {
1450         \vbox_unpack_drop:N \g_@@_output_box

```

We will raise `\g_tmpa_bool` to exit the loop `\bool_do_until:nn` below.

```

1451     \bool_gset_false:N \g_tmpa_bool
1452     \unskip \unskip

```

We begin the loop.

```

1453     \bool_do_until:nn \g_tmpa_bool
1454     {
1455         \unskip \unskip \unskip
1456         \int_set_eq:NN \l_tmpa_int \lastpenalty
1457         \unpenalty \unkern

```

In standard TeX (not LuaTeX), the only way to loop over the sub-boxes of a given box is to use the TeX primitive `\lastbox` (via `\box_set_to_last:N` of L3). Of course, it would be interesting to replace that programming by a programming in Lua of LuaTeX...

```

1458     \box_set_to_last:N \l_@@_line_box
1459     \box_if_empty:NTF \l_@@_line_box
1460     { \bool_gset_true:N \g_tmpa_bool }
1461     {

```

`\g_@@_line_int` will be used in `\@@_add_background_to_line_and_use:`.

```

1462     \vbox_gset:Nn \g_@@_output_box
1463     {

```

The command `\@@_add_background_to_line_and_use:` will add a background to the line (in `\l_@@_line_box`) but will also put the line in the current box. The background will have a width equal to `\l_@@_listing_width_dim`.

```

1464             \@@_add_background_to_line_and_use:
1465             \kern -2.5 pt
1466             \penalty \l_tmpa_int
1467             \vbox_unpack:N \g_@@_output_box
1468             }
1469             }
1470             \int_gdecr:N \g_@@_line_int
1471             }
1472             }
1473         }

```

The following will be used when the end user has used `print=false`.

```

1474 \cs_new_protected:Npn \@@_gobble_parse_no_print:n
1475 {
1476     \lua_now:e
1477     {
1478         piton.GobbleParseNoPrint
1479         (

1722           { \l_@@_SetPitonStyle_option_str _ }
1723         #1
1724       }
1725     { ##1 }
1726   }
1727 }
1728 }

1729 \keys_define:nn { piton / Styles }
1730 {
1731   String      .meta:n = { String.Long = #1 , String.Short = #1 } ,
1732   String      .value_required:n = true ,
1733   Comment.Math .tl_set:c = pitonStyle _ Comment.Math ,
1734   Comment.Math .value_required:n = true ,
1735   unknown     .code:n = \@@_unknown_style:
1736 }
1737 }
```

For the langage expl, it's possible to create "on the fly" some styles of the form Module.name or Type.name. For the other languages, it's not possible.

```

1738 \cs_new_protected:Npn \@@_unknown_style:
1739 {
1740   \str_if_eq:eeTF \l_@@_SetPitonStyle_option_str { expl }
1741   {
1742     \seq_set_split:Nne \l_tmpa_seq { . } \l_keys_key_str
1743     \seq_get_left:NN \l_tmpa_seq \l_tmpa_str
```

Now, the first part of the key (before the first period) is stored in \l\_tmpa\_str.

```
1744 \bool_lazy_and:nnTF
1745   { \int_compare_p:nNn { \seq_count:N \l_tmpa_seq } > { 1 } }
```

```

1746     {
1747         \str_if_eq_p:Vn \l_tmpa_str { Module }
1748         ||
1749         \str_if_eq_p:Vn \l_tmpa_str { Type }
1750     }

```

Now, we will create a new style.

```

1751     { \tl_set:co { pitonStyle _ expl _ \l_keys_key_str } \l_keys_value_tl }
1752     { \@@_error:n { Unknown-key-for-SetPitonStyle } }

```

We have, when **break-lines-in-Piton** is in force, to replace the spaces by `\@@_breakable_space`: because, when we have done a similar job in `\@@_replace_spaces:n` used in `\@@_begin_line:`, that job was not able to do the replacement in the brace group `{...}` of `\PitonStyle{String.Long}{...}` because we used a `\tl_replace_all:NVn`. At that time, it would have been possible to use a `\tl_regex_replace_all:Nnn` but it is notoriously slow.

### 2.0.9 The initial styles

The initial styles are inspired by the style “manni” of Pygments.

```
1850 \SetPitonStyle
1851 {
1852     Comment          = \color [ HTML ] { 0099FF } \itshape ,
1853     Comment.Internal = \@@_comment:n ,
1854     Exception        = \color [ HTML ] { CC0000 } ,
1855     Keyword          = \color [ HTML ] { 006699 } \bfseries ,
1856     Keyword.Governing = \color [ HTML ] { 006699 } \bfseries ,
1857     Keyword.Constant = \color [ HTML ] { 006699 } \bfseries ,
1858     Name.Builtin      = \color [ HTML ] { 336666 } ,
1859     Name.Decorator    = \color [ HTML ] { 9999FF } ,
1860     Name.Class        = \color [ HTML ] { 00AA88 } \bfseries ,
1861     Name.Function     = \color [ HTML ] { CC00FF } ,
1862     Name.Namespace    = \color [ HTML ] { 00CCFF } ,
1863     Name.Constructor   = \color [ HTML ] { 006000 } \bfseries ,
1864     Name.Field         = \color [ HTML ] { AA6600 } ,
1865     Name.Module        = \color [ HTML ] { 0060A0 } \bfseries ,
1866     Name.Table         = \color [ HTML ] { 309030 } ,
1867     Number            = \color [ HTML ] { FF6600 } ,
1868     Number.Internal   = \@@_number:n ,
1869     Operator          = \color [ HTML ] { 555555 } ,
1870     Operator.Word     = \bfseries ,
1871     String             = \color [ HTML ] { CC3300 } ,
1872     String.Long.Internal = \@@_string_long:n ,
1873     String.Short.Internal = \@@_string_short:n ,
1874     String.Doc.Internal = \@@_string_doc:n ,
1875     String.Doc        = \color [ HTML ] { CC3300 } \itshape ,
1876     String.Interpol    = \color [ HTML ] { AA0000 } ,
1877     Comment.LaTeX      = \normalfont \color [ rgb ] { .468, .532, .6 } ,
1878     Name.Type          = \color [ HTML ] { 336666 } ,
1879     InitialValues     = \@@_piton:n ,
1880     Interpol.Inside   = { \l_@@_font_command_t1 \@@_piton:n } ,
1881     TypeParameter     = \color [ HTML ] { 336666 } \itshape ,
1882     Preproc            = \color [ HTML ] { AA6600 } \slshape ,
```

We need the command `\@@_identifier:n` because of the command `\SetPitonIdentifier`. The command `\@@_identifier:n` will potentially call the style `Identifier` (which is a user-style, not an internal style).

```
1883 Identifier.Internal = \@@_identifier:n ,
1884 Identifier          = ,
1885 Directive           = \color [ HTML ] { AA6600 } ,
1886 Tag                 = \colorbox { gray!10 } ,
1887 UserFunction        = \PitonStyle { Identifier } ,
1888 Prompt              = ,
1889 Discard             = \use_none:n
1890 }
```

### 2.0.10 Styles specific to the language expl

```

1941   Module.vbox  = \color [ HTML ] { 267910 }
1942 }

```

If the key `math-comments` has been used in the preamble of the LaTeX document, we change the style `Comment.Math` which should be considered only at an “internal style”. However, maybe we will document in a future version the possibility to write change the style *locally* in a document].

```

1943 \hook_gput_code:nnn { begindocument } { . }
1944 {
1945   \bool_if:NT \g_@@_math_comments_bool
1946     { \SetPitonStyle { Comment.Math = \@@_math_scantokens:n } }
1947 }

```

## 2.0.11 Highlighting some identifiers

```

1948 \NewDocumentCommand { \SetPitonIdentifier } { o m m }
1949 {
1950   \clist_set:Nn \l_tmpa_clist { #2 }
1951   \tl_if_no_value:nTF { #1 }
1952   {
1953     \clist_map_inline:Nn \l_tmpa_clist

```

```

1954     { \cs_set:cpn { PitonIdentifier _ ##1 } { #3 } }
1955   }
1956   {
1957     \str_set:Ne \l_tmpa_str { \str_lowercase:n { #1 } }
1958     \str_if_eq:onT \l_tmpa_str { current-language }
1959       { \str_set_eq:NN \l_tmpa_str \l_piton_language_str }
1960     \clist_map_inline:Nn \l_tmpa_clist
1961       { \cs_set:cpn { PitonIdentifier _ \l_tmpa_str _ ##1 } { #3 } }
1962   }
1963 }
1964 \cs_new_protected:Npn \@@_identifier:n #1
1965 {
1966   \cs_if_exist_use:cF { PitonIdentifier _ \l_piton_language_str _ #1 }
1967   {
1968     \cs_if_exist_use:cF { PitonIdentifier _ #1 }
1969       { \PitonStyle { Identifier } }
1970   }
1971 { #1 }
1972 }

```

In particular, we have an highlighting of the identifiers which are the names of Python functions previously defined by the user. Indeed, when a Python function is defined, the style `Name.Function.Internal` is applied to that name. We define now that style (you define it directly and you short-cut the function `\SetPitonStyle`).

```

1973 \cs_new_protected:cpn { pitonStyle _ Name.Function.Internal } #1
1974 {

```

First, the element is composed in the TeX flow with the style `Name.Function` which is provided to the end user.

```

1975   { \PitonStyle { Name.Function } { #1 } }

```

Now, we specify that the name of the new Python function is a known identifier that will be formatted with the Piton style `UserFunction`. Of course, here the affectation is global because we have to exit many groups and even the environments `{Piton}`.

```

1976   \cs_gset_protected:cpn { PitonIdentifier _ \l_piton_language_str _ #1 }
1977     { \PitonStyle { UserFunction } }

```

Now, we put the name of that new user function in the dedicated sequence (specific of the current language). **That sequence will be used only by `\PitonClearUserFunctions`**.

```

1978   \seq_if_exist:cF { g_@@_functions _ \l_piton_language_str _ seq }
1979     { \seq_new:c { g_@@_functions _ \l_piton_language_str _ seq } }
1980   \seq_gput_right:cn { g_@@_functions _ \l_piton_language_str _ seq } { #1 }

```

We update `\g_@@_languages_seq` which is used only by the command `\PitonClearUserFunctions` when it's used without its optional argument.

```

1981   \seq_if_in:NoF \g_@@_languages_seq { \l_piton_language_str }
1982     { \seq_gput_left:No \g_@@_languages_seq { \l_piton_language_str } }
1983 }
1984 \NewDocumentCommand \PitonClearUserFunctions { ! o }
1985   {
1986     \tl_if_novalue:nTF { #1 }

```

If the command is used without its optional argument, we will deleted the user language for all the computer languages.

```

1987   { \@@_clear_all_functions: }
1988     { \@@_clear_list_functions:n { #1 } }
1989 }

1990 \cs_new_protected:Npn \@@_clear_list_functions:n #1
1991   {

```

The group is for the modifications of the the dictionary `l_pdffile/Filespec`

```
2031 %           \group_begin:
2032 %
```

We create a new PDF object but, in fact, it won't be really used.

```
2033 %           \pdf_object_new:n { piton / join / ##1 }
2034 %
```

The stream of the file is created by Lua (in the Lua side of LuaLaTeX) but the file itself will be added to the catalog of the PDF file in the LaTeX part of Lualatex by using the command `\pdfmanagement_add:nne` of `pdfmanagement`.

```
2035 %           \lua_now:n { pdf.immediateobj ( "stream" , piton.join_files["##1"] ) }
2036 %
```

The value of the key `/AFRelationship` must be a name of PDF (beginning with a solidus).

```
2037 %           \pdfdict_put:n { l_pdffile / Filespec } { AFRelationship } { /Supplement }
2038 %
```

The value of the key `/Desc` must be a string of PDF (between parenthesis).

```
2039 %           \pdfdict_put:n { l_pdffile / Filespec } { Desc } { (Computer-listing) }
2040 %           \pdffile_filespec:n { piton / join / ##1 } { ##1 } { \pdf_object_ref_last: }
2041 %
```

It's mandatory to use `\pdfmanagement_add:nne` to add to the catalog of the PDF in order to avoid clashes with other extensions writing to the catalog.

```
2042 %           \pdfmanagement_add:nne
2043 %           { Catalog / Names }
2044 %           { EmbeddedFiles }
2045 %           { \pdf_object_ref_last: }
2046 %           \group_end:
2047 %       }
2048 %   }
2049 %
```

Here is a version of the previous code with a direct code for the PDF dictionary `/FileSpec`.

```
2050 \cs_new_protected:Npn \@@_join_files:
2051 {
2052     \seq_map_inline:Nn \g_@@_join_seq
2053     {
2054         \lua_now:n { pdf.immediateobj ( "stream" , piton.join_files["##1"] ) }
2055         \str_set_convert:Nnnn \l_tmpa_str { ##1 } { } { utf16/hex }
2056         \pdfmanagement_add:nne { Catalog / Names } { EmbeddedFiles }
2057         {
2058             <<
2059                 /Type /Filespec
2060                 /UF <\l_tmpa_str>
2061                 /EF << /F-\pdf_object_ref_last: >>
2062                 /Desc (Computer-listing)
2063                 /AFRelationship /Supplement
2064             >>
2065         }
2066     }
2067 }
```

The legacy version of `\@@_join_files:` will be used when the new package `pdfmanagement` is *not* used. In that case, we can't insert the file directly in the catalog of the pdf file. Therefore, we insert the file linked to a annotation in a page of the PDF file. We try to make the annotation itself invisible with several technics.

```
2068 \cs_new_protected:Npn \@@_join_files_legacy:
2069 {
2070     \seq_map_inline:Nn \g_@@_join_seq
2071     {
2072         \str_set_convert:Nnnn \l_tmpa_str { ##1 } { } { utf16/hex }
2073         \lua_now:n { pdf.immediateobj ( "stream" , piton.join_files["##1"] ) }
2074         \pdfextension annot~width~Opt~height~Opt~depth~Opt
```

The entry `/F` in the PDF dictionary of the annotation is an unsigned 32-bit integer containing flags specifying various characteristics of the annotation. The bit in position 2 means *Hidden*. However, despite that bit which means *Hidden*, some PDF readers show the annotation. That's why we have used `width Opt height Opt depth Opt`.

```
2075     {
2076         /Subtype /FileAttachment
2077         /F~2
2078         /Name /Paperclip
2079         /Contents (Computer-listing)
2080         /FS <<
2081             /Type /Filespec
```

We have previously converted the name of the embedded file in `utf16/hex` with the BOM of big endian and now we can write a PDF string between < and > (with that encoding).

```
2082           /UF <\l_tmpa_str>
2083           /EF << /F~\pdf_object_ref_last: >>
2084           /AFRelationship /Supplement
2085           >>
2086       }
2087   }
2088 }
```

## 2.0.12 Spaces of indentation

```
2089 \cs_new_protected:Npn \@@_define_leading_space_normal:

### 2.0.15 We load piton.lua

```

2364 \cs_new_protected:Npn \@@_test_version:n #1
2365 {
2366     \str_if_eq:onF \PitonFileVersion { #1 }
2367     { \@@_error:n { bad~version~of~piton.lua } }
2368 }

2369 \hook_gput_code:nnn { begindocument } { . }
2370 {
2371     \lua_load_module:n { piton }
2372     \lua_now:n
2373     {
2374         \tex.sprint ( luatexbase.catcodetables.expl ,
2375             [[\@@_test_version:n {}] .. piton_version .. "}" )
2376     }
2377 }
2378
</STY>

```

## 3 The Lua part of the implementation

The Lua code will be loaded via a `{luacode*}` environment. The environment is by itself a Lua block and the local declarations will be local to that block. All the global functions (used by the L3 parts of the implementation) will be put in a Lua table called `piton`.

```

2378 {*LUA}
2379 piton.comment_latex = piton.comment_latex or ">"
2380 piton.comment_latex = "#" .. piton.comment_latex

```

The table `piton.write_files` will contain the contents of all the files that we will write on the disk in the `\AtEndDocument` (if the user has used the key `write-file`). The table `piton.join_files` is similar for the key `join`.

```

2381 piton.write_files = { }
2382 piton.join_files = { }

2383 local sprintL3
2384 function sprintL3 ( s )
2385     \tex.sprint ( luatexbase.catcodetables.expl , s )
2386 end

```

### 3.1 Special functions dealing with LPEG

We will use the Lua library `lpeg` which is built in LuaTeX. That's why we define first aliases for several functions of that library.

```

2387 local P, S, V, C, Ct, Cc = lpeg.P, lpeg.S, lpeg.V, lpeg.C, lpeg.Ct, lpeg.Cc
2388 local Cg, Cmt, Cb = lpeg.Cg, lpeg.Cmt, lpeg.Cb
2389 local B, R = lpeg.B, lpeg.R

```

The following line is mandatory.

```

2390 lpeg.locale(lpeg)

```

### 3.2 The functions Q, K, WithStyle, etc.

The function `Q` takes in as argument a pattern and returns a LPEG *which does a capture* of the pattern. That capture will be sent to LaTeX with the catcode “other” for all the characters: it’s suitable for elements of the computer listings that piton will typeset verbatim (thanks to the catcode “other”).

```
2391 local Q
2392 function Q ( pattern )
2393     return Ct ( Cc ( luatexbase.catcodetables.other ) * C ( pattern ) )
2394 end
```

The function `L` takes in as argument a pattern and returns a LPEG *which does a capture* of the pattern. That capture will be sent to LaTeX with standard LaTeX catcodes for all the characters: the elements captured will be formatted as normal LaTeX codes. It’s suitable for the “LaTeX comments” in the environments `{Piton}` and the elements between `begin-escape` and `end-escape`. That function won’t be much used.

```
2395 local L
2396 function L ( pattern ) return
2397     Ct ( C ( pattern ) )
2398 end
```

The function `Lc` (the `c` is for *constant*) takes in as argument a string and returns a LPEG *with does a constant capture* which returns that string. The elements captured will be formatted as L3 code. It will be used to send to LaTeX all the formatting LaTeX instructions we have to insert in order to do the syntactic highlighting (that’s the main job of piton). That function, unlike the previous one, will be widely used.

```
2399 local Lc
2400 function Lc ( string ) return
2401     Cc ( { luatexbase.catcodetables.expl , string } )
2402 end
```

The function `K` creates a LPEG which will return as capture the whole LaTeX code corresponding to a Python chunk (that is to say with the LaTeX formatting instructions corresponding to the syntactic nature of that Python chunk). The first argument is a Lua string corresponding to the name of a piton style and the second element is a pattern (that is to say a LPEG without capture)

```
2403 local K
2404 function K ( style , pattern ) return
2405     Lc ( [[ {\PitonStyle{}} .. style .. "}{"] )
2406     * Q ( pattern )
2407     * Lc "}{"
2408 end
```

The formatting commands in a given piton style (eg. the style `Keyword`) may be semi-global declarations (such as `\bfseries` or `\slshape`) or LaTeX macros with an argument (such as `\fbox` or `\colorbox{yellow}`). In order to deal with both syntaxes, we have used two pairs of braces: `{\PitonStyle{Keyword}{text to format}}`.

The following function `WithStyle` is similar to the function `K` but should be used for multi-lines elements.

```
2409 local WithStyle
2410 function WithStyle ( style , pattern ) return
2411     Ct ( Cc "Open" * Cc ( [[ {\PitonStyle{}} .. style .. "}{"] ) * Cc "}{"
2412     * pattern
2413     * Ct ( Cc "Close" )
2414 end
```

The following LPEG catches the Python chunks which are in LaTeX escapes (and that chunks will be considered as normal LaTeX constructions).

```
2415 Escape = P ( false )
2416 EscapeClean = P ( false )
```

```

2417 if piton.begin_escape then
2418   Escape =
2419   P ( piton.begin_escape )
2420   * L ( ( 1 - P ( piton.end_escape ) ) ^ 1 )
2421   * P ( piton.end_escape )

```

The LPEG EscapeClean will be used in the LPEG Clean (and that LPEG is used to “clean” the code by removing the formatting elements).

```

2422 EscapeClean =
2423   P ( piton.begin_escape )
2424   * ( 1 - P ( piton.end_escape ) ) ^ 1
2425   * P ( piton.end_escape )
2426 end

2427 EscapeMath = P ( false )
2428 if piton.begin_escape_math then
2429   EscapeMath =
2430   P ( piton.begin_escape_math )
2431   * Lc "$"
2432   * L ( ( 1 - P(piton.end_escape_math) ) ^ 1 )
2433   * Lc "$"
2434   * P ( piton.end_escape_math )
2435 end

```

## The basic syntactic LPEG

```

2436 local alpha , digit = lpeg.alpha , lpeg.digit
2437 local space = P " "

```

Remember that, for LPEG, the Unicode characters such as à, á, ç, etc. are in fact strings of length 2 (2 bytes) because lpeg is not Unicode-aware.

```

2438 local letter = alpha + "_" + "â" + "à" + "ç" + "é" + "è" + "ê" + "ë" + "ï" + "î"
2439           + "ô" + "û" + "ü" + "Â" + "À" + "Ç" + "É" + "È" + "Ê" + "Ë"
2440           + "Ï" + "Î" + "Ô" + "Û" + "Ü"
2441
2442 local alphanum = letter + digit

```

The following LPEG `identifier` is a mere pattern (that is to say more or less a regular expression) which matches the Python identifiers (hence the name).

```
2443 local identifier = letter * alphanum ^ 0
```

On the other hand, the LPEG `Identifier` (with a capital) also returns a *capture*.

```
2444 local Identifier = K ( 'Identifier.Internal' , identifier )
```

**By convention, we will use names with an initial capital for LPEG which return captures.**

The following functions allow to recognize numbers that contains `_` among their digits, for example `1_000_000`, but also floating point numbers, numbers with exponents and numbers with different bases.<sup>4</sup>

```

2445 local allow_underscores_except_first
2446 function allow_underscores_except_first ( p )
2447   return p * (P "_" + p)^0
2448 end
2449 local allow_underscores
2450 function allow_underscores ( p )
2451   return (P "_" + p)^0
2452 end
2453 local digits_to_number
2454 function digits_to_number(prefix, digits)

```

---

<sup>4</sup>The edge cases such as

```

2455 -- The edge cases of what is allowed in number litterals is modelled after
2456 -- OCaml numbers, which seems to be the most permissive language
2457 -- in this regard (among C, OCaml, Python & SQL).
2458 return prefix
2459   * allow_underscores_except_first(digits^1)
2460   * (P "." * #(1 - P ".") * allow_underscores(digits))^-1
2461   * (S "eE" * S "+-^-1 * allow_underscores_except_first(digits^1))^-1
2462 end

```

Here is the first use of our function K. That function will be used to construct LPEG which capture Python chunks for which we have a dedicated piton style. For example, for the numbers, piton provides a style which is called **Number**. The name of the style is provided as a Lua string in the second argument of the function K. By convention, we use single quotes for delimiting the Lua strings which are names of piton styles (but this is only a convention).

```

2463 local Number =
2464   K ( 'Number.Internal' ,
2465     digits_to_number (P "0x" + P "OX", R "af" + R "AF" + digit)
2466     + digits_to_number (P "0o" + P "OO", R "07")
2467     + digits_to_number (P "0b" + P "OB", R "01")
2468     + digits_to_number ( "", digit )
2469   )

```

We will now define the LPEG Word.

We have a problem in the following LPEG because, obviously, we should adjust the list of symbols with the delimiters of the current language (no?).

```
2470 local lpeg_central = 1 - S " '\r[{}]" - digit
```

We recall that piton.begin\_escape and piton\_end\_escape are Lua strings corresponding to the keys **begin-escape** and **end-escape**.

```

2471 if piton.begin_escape then
2472   lpeg_central = lpeg_central - piton.begin_escape
2473 end
2474 if piton.begin_escape_math then
2475   lpeg_central = lpeg_central - piton.begin_escape_math
2476 end
2477 local Word = Q ( lpeg_central ^ 1 )

2478 local Space = Q " " ^ 1
2479 local SkipSpace = Q " " ^ 0
2480
2481 local Punct = Q ( S ",;:;" )
2482
2483 local Tab = "\t" * Lc [[ \@@_tab: ]]

2484 local LeadingSpace = Lc [[ \@@_leading_space: ]] * P " "
2485 local Delim = Q ( S "[{}]" )

```

The following LPEG catches a space (U+0020) and replaces it by \l\_@@\_space\_in\_string\_t1. It will be used in the strings. Usually, \l\_@@\_space\_in\_string\_t1 will contain a space and therefore there won't be any difference. However, when the key **show-spaces-in-strings** is in force, \\\l\_@@\_space\_in\_string\_t1 will contain □ (U+2423) in order to visualize the spaces.

```
2486 local SpaceInString = space * Lc [[ \l_@@_space_in_string_t1 ]]
```

### 3.3 The option 'detected-commands' and al.

We create four Lua tables called `detected_commands`, `raw_detected_commands`, `beamer_commands` and `beamer_environments`.

On the TeX side, the corresponding data have first been stored as clists.

Then, in a `\AtBeginDocument`, they have been converted in “toks registers” of TeX.

Now, on the Lua side, we are able to access to those “toks registers” with the special pseudo-table `tex.toks` of LuaTeX.

Remark that we can safely use `explode('')` to convert such “toks registers” in Lua tables since, in aclist of L3, there is no empty component and, for each component, there is no space on both sides (the `explode` of the Lua of LuaTeX is unable to do itself such purification of the components).

```
2487 local detected_commands = tex.toks.PitonDetectedCommands : explode ( ',' )
2488 local raw_detected_commands = tex.toks.PitonRawDetectedCommands : explode ( ',' )
2489 local beamer_commands = tex.toks.PitonBeamerCommands : explode ( ',' )
2490 local beamer_environments = tex.toks.PitonBeamerEnvironments : explode ( ',' )
```

We will also create some LPEG.

According to our conventions, a LPEG with a name in camelCase is a LPEG which doesn’t do any capture.

```
2491 local detectedCommands = P ( false )
2492 for _ , x in ipairs ( detected_commands ) do
2493     detectedCommands = detectedCommands + P ( "\\" .. x )
2494 end
```

Further, we will have a LPEG called `DetectedCommands` (in PascalCase) which will be a LPEG *with* captures.

```
2495 local rawDetectedCommands = P ( false )
2496 for _ , x in ipairs ( raw_detected_commands ) do
2497     rawDetectedCommands = rawDetectedCommands + P ( "\\" .. x )
2498 end
2499 local beamerCommands = P ( false )
2500 for _ , x in ipairs ( beamer_commands ) do
2501     beamerCommands = beamerCommands + P ( "\\" .. x )
2502 end
2503 local beamerEnvironments = P ( false )
2504 for _ , x in ipairs ( beamer_environments ) do
2505     beamerEnvironments = beamerEnvironments + P ( x )
2506 end
```

### Several tools for the construction of the main LPEG

```
2507 local LPEG0 = { }
2508 local LPEG1 = { }
2509 local LPEG2 = { }
2510 local LPEG_cleaner = { }
```

For each language, we will need a pattern to match expressions with balanced braces. Those balanced braces must *not* take into account the braces present in strings of the language. However, the syntax for the strings is language-dependent. That’s why we write a Lua function `Compute_braces` which will compute the pattern by taking in as argument a pattern for the strings of the language (at least the shorts strings). The argument of `Compute_braces` must be a pattern *which does no captures*.

```
2511 local Compute_braces
2512 function Compute_braces ( lpeg_string ) return
2513     P { "E" ,
2514         E =
2515             (
2516                 "{" * V "E" * "}"
2517                 +
2518                 lpeg_string
```

```

2519      +
2520      ( 1 - S "{}" )
2521      ) ^ 0
2522  }
2523 end

```

The following Lua function will compute the lpeg `DetectedCommands` which is a LPEG with captures.

```

2524 local Compute_DetectedCommands
2525 function Compute_DetectedCommands ( lang , braces ) return
2526   Ct (
2527     Cc "Open"
2528     * C ( detectedCommands * space ^ 0 * P "{}" )
2529     * Cc "}"
2530   )
2531   * ( braces
2532     / ( function ( s )
2533       if s ~= '' then return
2534         LPEG1[lang] : match ( s )
2535       end
2536     end )
2537   )
2538   * P "}"
2539   * Ct ( Cc "Close" )
2540 end
2541 local Compute_RawDetectedCommands
2542 function Compute_RawDetectedCommands ( lang , braces ) return
2543   Ct ( C ( rawDetectedCommands * space ^ 0 * P "{}" * braces * P "{}" ) )
2544 end
2545
2546 local Compute_LPEG_cleaner
2547 function Compute_LPEG_cleaner ( lang , braces ) return
2548   Ct ( ( detectedCommands + rawDetectedCommands ) * "{}"
2549     * ( braces
2550       / ( function ( s )
2551         if s ~= '' then return
2552           LPEG_cleaner[lang] : match ( s )
2553         end
2554       end )
2555     )
2556     * "}"
2557     + EscapeClean
2558     + C ( P ( 1 ) )
2559   ) ^ 0 ) / table.concat
2560 end

```

The following function `ParseAgain` will be used in the definitions of the LPEG of the different computer languages when we will need to *parse again* a small chunk of code. It's a way to avoid the use of a actual *grammar* of LPEG (in a sens, a recursive regular expression).

Remark that there is no piton style associated to a chunk of code which is analyzed by `ParseAgain`. If we wish a piton style available to the end user (if he wish to format that element with a uniform font instead of an analyze by `ParseAgain`), we have to use \@@\_piton:n.

```

2560 local ParseAgain
2561 function ParseAgain ( code )
2562   if code ~= '' then return

```

The variable `piton.language` is set in the function `piton.Parse`.

```

2563   LPEG1[piton.language] : match ( code )
2564 end
2565 end

```

**Constructions for Beamer** If the class Beamer is used, some environments and commands of Beamer are automatically detected in the listings of piton.

```
2566 local Beamer = P ( false )
```

The following Lua function will be used to compute the LPEG **Beamer** for each computer language. According to our conventions, the LPEG **Beamer**, with its name in PascalCase does captures.

```
2567 local Compute_Beamer
2568 function Compute_Beamer ( lang , braces )
```

We will compute in **lpeg** the LPEG that we will return.

```
2569 local lpeg = L ( P [[\pause]] * ( "[" * ( 1 - P "]" ) ^ 0 * "]" ) ^ -1 )
2570 lpeg = lpeg +
2571   Ct ( Cc "Open"
2572     * C ( beamerCommands
2573       * ( "<" * ( 1 - P ">" ) ^ 0 * ">" ) ^ -1
2574       * P "{"
2575         )
2576       * Cc "}"
2577     )
2578   * ( braces /
2579     ( function ( s ) if s ~= '' then return LPEG1[lang] : match ( s ) end end ) )
2580   * "}"
2581   * Ct ( Cc "Close" )
```

For the command **\alt**, the specification of the overlays (between angular brackets) is mandatory.

```
2582 lpeg = lpeg +
2583   L ( P [[\alt]] * "<" * ( 1 - P ">" ) ^ 0 * ">{" )
2584   * ( braces /
2585     ( function ( s ) if s ~= '' then return LPEG1[lang] : match ( s ) end end ) )
2586   * L ( P "}{" )
2587   * ( braces /
2588     ( function ( s ) if s ~= '' then return LPEG1[lang] : match ( s ) end end ) )
2589   * L ( P "}" )
```

For **\temporal**, the specification of the overlays (between angular brackets) is mandatory.

```
2590 lpeg = lpeg +
2591   L ( P [[\temporal]] * "<" * ( 1 - P ">" ) ^ 0 * ">{" )
2592   * ( braces
2593     / ( function ( s )
2594       if s ~= '' then return LPEG1[lang] : match ( s ) end end ) )
2595   * L ( P "}{" )
2596   * ( braces
2597     / ( function ( s )
2598       if s ~= '' then return LPEG1[lang] : match ( s ) end end ) )
2599   * L ( P "}{" )
2600   * ( braces
2601     / ( function ( s )
2602       if s ~= '' then return LPEG1[lang] : match ( s ) end end ) )
2603   * L ( P "}" )
```

Now, the environments of Beamer.

```
2604 for _ , x in ipairs ( beamer_environments ) do
2605   lpeg = lpeg +
2606     Ct ( Cc "Open"
2607       * C (
2608         P ( [[\begin{}]] .. x .. "}" )
2609           * ( "<" * ( 1 - P ">" ) ^ 0 * ">" ) ^ -1
2610         )
2611       * space ^ 0 * ( P "\r" ) ^ 1 -- added 25/08/23
2612       * Cc ( [[\end{}]] .. x .. "}" )
```

```

2613         )
2614     * (
2615         ( ( 1 - P ( [[:end{}]] .. x .. "}" ) ) ^ 0 )
2616         / ( function ( s )
2617             if s ~= '' then return
2618                 LPEG1[lang] : match ( s )
2619             end
2620         end
2621     )
2622     * P ( [[:end{}]] .. x .. "}" )
2623     * Ct ( Cc "Close" )
2624 end

```

Now, you can return the value we have computed.

```

2625     return lpeg
2626 end

```

The following LPEG is in relation with the key `math-comments`. It will be used in all the languages.

```

2627 local CommentMath =
2628     P "$" * K ( 'Comment.Math' , ( 1 - S "$\r" ) ^ 1 ) * P "$" -- $

```

**EOL** There may be empty lines in the transcription of the prompt, *id est* lines of the form ... without space after and that's why we need `P " " ^ -1` with the `^ -1`.

```

2629 local Prompt =
2630     K ( 'Prompt' , ( P ">>>" + "..." ) * P " " ^ -1 )
2631     * Lc [[ \rowcolor {\l @@_prompt_bg_color_t1} ]]

```

The following LPEG EOL is for the end of lines.

```

2632 local EOL =
2633     P "\r"
2634     *
2635     (
2636         space ^ 0 * -1
2637         +
2638         Cc "EOL"
2639     )
2640     * ( LeadingSpace ^ 0 * # ( 1 - S "\r" ) ) ^ -1

```

The following LPEG `CommentLaTeX` is for what is called in that document the “`\LaTeX` comments”.

```

2641 local CommentLaTeX =
2642     P ( piton.comment_latex )
2643     * Lc [[{\PitonStyle{Comment.LaTeX}}{\ignorespaces}]]
2644     * L ( ( 1 - P "\r" ) ^ 0 )
2645     * Lc "}"
2646     * ( EOL + -1 )

```

### 3.4 The language Python

We open a Lua local scope for the language Python (of course, there will be also global definitions).

```

2647 --python Python
2648 do

```

Some strings of length 2 are explicit because we want the corresponding ligatures available in some fonts such as *Fira Code* to be active.

```

2649 local Operator =
2650   K ( 'Operator' ,
2651       P "!=" + "<>" + "==" + "<<" + ">>" + "<=" + ">=" + ":=" + "//" + "/*"
2652       + S "--+/*%=<>&.@|/" )
2653
2654 local OperatorWord =
2655   K ( 'Operator.Word' , P "in" + "is" + "and" + "or" + "not" )

```

The keyword `in` in a construction such as “`for i in range(n)`” must be formatted as a keyword and not as an `Operator.Word` and that’s why we write the following LPEG For.

```

2656 local For = K ( 'Keyword' , P "for" )
2657     * Space
2658     * Identifier
2659     * Space
2660     * K ( 'Keyword' , P "in" )

2661
2662 local Keyword =
2663     K ( 'Keyword' ,
2664         P "assert" + "as" + "break" + "case" + "class" + "continue" + "def" +
2665         "del" + "elif" + "else" + "except" + "exec" + "finally" + "for" + "from" +
2666         "global" + "if" + "import" + "lambda" + "non local" + "pass" + "return" +
2667         "try" + "while" + "with" + "yield" + "yield from" )
2668     + K ( 'Keyword.Constant' , P "True" + "False" + "None" )

2669
2670 local Builtin =
2671     K ( 'Name.Builtin' ,
2672         P "__import__" + "abs" + "all" + "any" + "bin" + "bool" + "bytearray" +
2673         "bytes" + "chr" + "classmethod" + "compile" + "complex" + "delattr" +
2674         "dict" + "dir" + "divmod" + "enumerate" + "eval" + "filter" + "float" +
2675         "format" + "frozenset" + "getattr" + "globals" + "hasattr" + "hash" +
2676         "hex" + "id" + "input" + "int" + "isinstance" + "issubclass" + "iter" +
2677         "len" + "list" + "locals" + "map" + "max" + "memoryview" + "min" + "next" +
2678         + "object" + "oct" + "open" + "ord" + "pow" + "print" + "property" +
2679         "range" + "repr" + "reversed" + "round" + "set" + "setattr" + "slice" +
2680         "sorted" + "staticmethod" + "str" + "sum" + "super" + "tuple" + "type" +
2681         "vars" + "zip" )

2682
2683 local Exception =
2684     K ( 'Exception' ,
2685         P "ArithError" + "AssertionError" + "AttributeError" +
2686         "BaseException" + "BufferError" + "BytesWarning" + "DeprecationWarning" +
2687         "EOFError" + "EnvironmentError" + "Exception" + "FloatingPointError" +
2688         "FutureWarning" + "GeneratorExit" + "IOError" + "ImportError" +
2689         "ImportWarning" + "IndentationError" + "IndexError" + "KeyError" +
2690         "KeyboardInterrupt" + "LookupError" + "MemoryError" + "NameError" +
2691         "NotImplementedError" + "OSError" + "OverflowError" +
2692         "PendingDeprecationWarning" + "ReferenceError" + "ResourceWarning" +
2693         "RuntimeError" + "RuntimeWarning" + "StopIteration" + "SyntaxError" +
2694         "SyntaxWarning" + "SystemError" + "SystemExit" + "TabError" + "TypeError" +
2695         + "UnboundLocalError" + "UnicodeDecodeError" + "UnicodeEncodeError" +
2696         "UnicodeError" + "UnicodeTranslateError" + "UnicodeWarning" +

2703         "TimeoutError" + "StopAsyncIteration" + "ModuleNotFoundError" +
2704         "RecursionError" )

2705
2706 local RaiseException = K ( 'Keyword' , P "raise" ) * SkipSpace * Exception * Q ( "

```

In Python, a “decorator” is a statement whose begins by `@` which patches the function defined in the following statement.

```
2707 local Decorator = K ( 'Name.Decorator' , P "@" * letter ^ 1 )
```

The following LPEG `DefClass` will be used to detect the definition of a new class (the name of that new class will be formatted with the piton style `Name.Class`).

Example: `class myclass:`

```
2708 local DefClass =
2709     K ( 'Keyword' , "class" ) * Space * K ( 'Name.Class' , identifier )
```

If the word `class` is not followed by a identifier, it will be caught as keyword by the LPEG `Keyword` (useful if we want to type a list of keywords).

The following LPEG `ImportAs` is used for the lines beginning by `import`. We have to detect the potential keyword `as` because both the name of the module and its alias must be formatted with the piton style `Name.Namespace`.

Example: `import numpy as np`

Moreover, after the keyword `import`, it's possible to have a comma-separated list of modules (if the keyword `as` is not used).

Example: `import math, numpy`

```
2710 local ImportAs =
2711     K ( 'Keyword' , "import" )
2712     * Space
2713     * K ( 'Name.Namespace' , identifier * ( "." * identifier ) ^ 0 )
2714     *
2715     ( Space * K ( 'Keyword' , "as" ) * Space
2716         * K ( 'Name.Namespace' , identifier ) )
2717     +
2718     ( SkipSpace * Q "," * SkipSpace
2719         * K ( 'Name.Namespace' , identifier ) ) ^ 0
2720 )
```

Be careful: there is no commutativity of `+` in the previous expression.

The LPEG `FromImport` is used for the lines beginning by `from`. We need a special treatment because the identifier following the keyword `from` must be formatted with the piton style `Name.Namespace` and the following keyword `import` must be formatted with the piton style `Keyword` and must *not* be caught by the LPEG `ImportAs`.

Example: `from math import pi`

```
2721 local FromImport =
2722     K ( 'Keyword' , "from" )
2723     * Space * K ( 'Name.Namespace' , identifier )
2724     * Space * K ( 'Keyword' , "import" )
```

**The strings of Python** For the strings in Python, there are four categories of delimiters (without counting the prefixes for f-strings and raw strings). We will use, in the names of our LPEG, prefixes to distinguish the LPEG dealing with that categories of strings, as presented in the following tabular.

	Single	Double
Short	'text'	"text"
Long	'''test'''	"""text"""

We have also to deal with the interpolations in the f-strings. Here is an example of a f-string with an interpolation and a format instruction<sup>5</sup> in that interpolation:

```
\piton{f'Total price: {total:.2f} €'}
```

The interpolations beginning by % (even though there is more modern techniques now in Python).

```
2725 local PercentInterpol =
2726   K ( 'String.Interpol' ,
2727     P "%"
2728     * ( "(" * alphanum ^ 1 * ")" ) ^ -1
2729     * ( S "-#0+" ) ^ 0
2730     * ( digit ^ 1 + "*" ) ^ -1
2731     * ( "." * ( digit ^ 1 + "*" ) ) ^ -1
2732     * ( S "HLL" ) ^ -1
2733     * S "sdfFeExXorgiGauc%"
2734   )
```

We can now define the LPEG for the four kinds of strings. It's not possible to use our function K because of the interpolations which must be formatted with another piton style that the rest of the string.<sup>6</sup>

```
2735 local SingleShortString =
2736   WithStyle ( 'String.Short.Internal' ,
```

First, we deal with the f-strings of Python, which are prefixed by f or F.

```
2737 Q ( P "f'" + "F'" )
2738   *
2739   ( K ( 'String.Interpol' , "{}" )
2740     * K ( 'Interpol.Inside' , ( 1 - S "}:;" ) ^ 0 )
2741     * Q ( P ":" * ( 1 - S "}:;" ) ^ 0 ) ^ -1
2742     * K ( 'String.Interpol' , "}" )
2743   +
2744   SpaceInString
2745   +
2746   Q ( ( P "\\" + "\\\\" + "{{" + "}}}" + 1 - S " {}'" ) ^ 1 )
2747   ) ^ 0
2748   * Q "''"
2749   +
```

Now, we deal with the standard strings of Python, but also the “raw strings”.

```
2750 Q ( P "''" + "r'" + "R'" )
2751   *
2752   ( Q ( ( P "\\" + "\\\\" + 1 - S " '\r%" ) ^ 1 )
2753     + SpaceInString
2754     + PercentInterpol
2755     + Q "%"
2756   ) ^ 0
2757   * Q "''" )

2758 local DoubleShortString =
2759   WithStyle ( 'String.Short.Internal' ,
2760     Q ( P "f\\"" + "F\\"" )
2761     *
2762     ( K ( 'String.Interpol' , "{}" )
2763       * K ( 'Interpol.Inside' , ( 1 - S "}\\";" ) ^ 0 )
2764       * ( K ( 'String.Interpol' , ":" ) * Q ( ( 1 - S "}\\";" ) ^ 0 ) ) ^ -1
2765       * K ( 'String.Interpol' , "}" )
2766     +
2767     SpaceInString
2768     +
2769     Q ( ( P "\\\\" + "\\\\" + "{{" + "}}}" + 1 - S " {}\"'" ) ^ 1 )
```

---

<sup>5</sup>There is no special piton style for the formatting instruction (after the colon): the style which will be applied will be the style of the encompassing string, that is to say `String.Short` or `String.Long`.

<sup>6</sup>The interpolations are formatted with the piton style `Interpol.Inside`. The initial value of that style is `\@_piton:n` which means that the interpolations are parsed once again by piton.

```

2769      ) ^ 0
2770      * Q "\\""
2771      +
2772      Q ( P "\\" + "r\\"" + "R\\"" )
2773      * ( Q ( ( P "\\\\" + "\\\\" + 1 - S "\x%" ) ^ 1 )
2774      + SpaceInString
2775      + PercentInterpol
2776      + Q "%"
2777      ) ^ 0
2778      * Q "\\" )
2779
2780 local ShortString = SingleShortString + DoubleShortString

```

**Beamer** The argument of Compute\_braces must be a pattern *which does no catching* corresponding to the strings of the language.

```

2781 local braces =
2782   Compute_braces
2783   (
2784     ( P "\\" + "r\\"" + "R\\"" + "f\\"" + "F\\"" )
2785     * ( P '\\\\' + 1 - S "\\" ) ^ 0 * "\\" "
2786   +
2787     ( P '\' + 'r\'' + 'R\'' + 'f\'' + 'F\'' )
2788     * ( P '\\\\' + 1 - S '\'' ) ^ 0 * '\'
2789   )
2790
2791 if piton.beamer then Beamer = Compute_Beamer ( 'python' , braces ) end

```

## Detected commands

```

2792 DetectedCommands = Compute_DetectedCommands ( 'python' , braces )
2793   + Compute_RawDetectedCommands ( 'python' , braces )

```

## LPEG\_cleaner

```

2794 LPEG_cleaner.python = Compute_LPEG_cleaner ( 'python' , braces )

```

## The long strings

```

2795 local SingleLongString =
2796   WithStyle ( 'String.Long.Internal' ,
2797   ( Q ( S "ff" * P "::::" )
2798     *
2799     K ( 'String.Interpol' , "{}" )
2800     * K ( 'Interpol.Inside' , ( 1 - S "{};\r" - "::::" ) ^ 0 )
2801     * Q ( P ":" * ( 1 - S "{};\r" - "::::" ) ^ 0 ) ^ -1
2802     * K ( 'String.Interpol' , "}" )
2803     +
2804     Q ( ( 1 - P "::::" - S "{}\r" ) ^ 1 )
2805     +
2806     EOL
2807   ) ^ 0
2808
2809   +
2810   Q ( ( S "rR" ) ^ -1 * "::::" )
2811   *
2812   Q ( ( 1 - P "::::" - S "\r%" ) ^ 1 )
2813   +
2814   PercentInterpol

```

```

2815      P "%"
2816      +
2817      EOL
2818      ) ^ 0
2819
2820      * Q "'''''' )
2821
2822 local DoubleLongString =
2823   WithStyle ( 'String.Long.Internal' ,
2824   (
2825     Q ( S "fF" * "\\"\\\"\\\" )
2826     *
2827     K ( 'String.Interpol', "{}" )
2828     * K ( 'Interpol.Inside' , ( 1 - S "}:\\r" - "\\\"\\\"\\\" ) ^ 0 )
2829     * Q ( ":" * ( 1 - S "}:\\r" - "\\\"\\\"\\\" ) ^ 0 ) ^ -1
2830     * K ( 'String.Interpol' , "}" )
2831     +
2832     Q ( ( 1 - S "{}\\r" - "\\\"\\\"\\\" ) ^ 1 )
2833     +
2834     EOL
2835     ) ^ 0
2836   +
2837   Q ( S "rR" ^ -1 * "\\\"\\\"\\\" )
2838   *
2839   Q ( ( 1 - P "\\\"\\\"\\\" - S "%\\r" ) ^ 1 )
2840   +
2841   PercentInterpol
2842   +
2843   P "%"
2844   +
2845   EOL
2846   ) ^ 0
2847   * Q "\\\"\\\"\\\""
2848 )
2849 local LongString = SingleLongString + DoubleLongString

```

We have a LPEG for the Python docstrings. That LPEG will be used in the LPEG DefFunction which deals with the whole preamble of a function definition (which begins with `def`).

```

2850 local StringDoc =
2851   K ( 'String.Doc.Internal' , P "r" ^ -1 * "\\\"\\\"\\\" )
2852   * ( K ( 'String.Doc.Internal' , ( 1 - P "\\\"\\\"\\\" - "\\r" ) ^ 0 ) * EOL
2853     * Tab ^ 0
2854     ) ^ 0
2855   * K ( 'String.Doc.Internal' , ( 1 - P "\\\"\\\"\\\" - "\\r" ) ^ 0 * "\\\"\\\"\\\" )

```

**The comments in the Python listings** We define different LPEG dealing with comments in the Python listings.

```

2856 local Comment =
2857   WithStyle
2858   ( 'Comment.Internal' ,
2859     Q "#" * ( CommentMath + Q ( ( 1 - S "$\\r" ) ^ 1 ) ) ^ 0 -- $
2860   )
2861   * ( EOL + -1 )

```

**DefFunction** The following LPEG expression will be used for the parameters in the *argspec* of a Python function. It's necessary to use a *grammar* because that pattern mainly checks the correct nesting of the delimiters (and it's known in the theory of formal languages that this can't be done with regular expressions *stricto sensu* only).

```

2862 local expression =
2863   P { "E" ,
2864     E = ( "" * ( P "\\" + 1 - S "\r" ) ^ 0 * ""
2865       + "\\" * ( P "\\\\" + 1 - S "\r" ) ^ 0 * "\"
2866       + "{" * V "F" * "}"
2867       + "(" * V "F" * ")"
2868       + "[" * V "F" * "]"
2869       + ( 1 - S "{}[]\r," ) ^ 0 ,
2870     F = ( "{" * V "F" * "}"
2871       + "(" * V "F" * ")"
2872       + "[" * V "F" * "]"
2873       + ( 1 - S "{}[]\r\" ) ^ 0
2874   }

```

We will now define a LPEG **Params** that will catch the list of parameters (that is to say the *argspec*) in the definition of a Python function. For example, in the line of code

```
def MyFunction(a,b,x=10,n:int): return n
```

the LPEG **Params** will be used to catch the chunk `a,b,x=10,n:int`.

```

2875 local Params =
2876   P { "E" ,
2877     E = ( V "F" * ( Q "," * V "F" ) ^ 0 ) ^ -1 ,
2878     F = SkipSpace * ( Identifier + Q "args" + Q "**kwargs" ) * SkipSpace
2879       * ( Q ":" * SkipSpace * K ( 'Name.Type' , identifier ) ) ^ -1
2880       * ( SkipSpace * K ( 'InitialValues' , "=" * SkipSpace * expression ) ) ^ -1
2881   }

```

The following LPEG **DefFunction** catches a keyword `def` and the following name of function *but also everything else until a potential docstring*. That's why this definition of LPEG must occur (in the file `piton.sty`) after the definition of several other LPEG such as `Comment`, `CommentLaTeX`, `Params`, `StringDoc`...

```

2882 local DefFunction =
2883   K ( 'Keyword' , "def" )
2884   * Space
2885   * K ( 'Name.Function.Internal' , identifier )
2886   * SkipSpace
2887   * Q "(" * Params * Q ")"
2888   * SkipSpace
2889   * ( Q "->" * SkipSpace * K ( 'Name.Type' , identifier ) ) ^ -1
2890   * ( C ( ( 1 - S ":r" ) ^ 0 ) / ParseAgain )
2891   * Q ":" 
2892   * ( SkipSpace
2893     * ( EOL + CommentLaTeX + Comment ) -- in all cases, that contains an EOL
2894     * Tab ^ 0
2895     * SkipSpace
2896     * StringDoc ^ 0 -- there may be additional docstrings
2897   ) ^ -1

```

Remark that, in the previous code, `CommentLaTeX` *must* appear before `Comment`: there is no commutativity of the addition for the *parsing expression grammars* (PEG).

If the word `def` is not followed by an identifier and parenthesis, it will be caught as keyword by the LPEG `Keyword` (useful if, for example, the end user wants to speak of the keyword `def`).

## Miscellaneous

```
2898 local ExceptionInConsole = Exception * Q ( ( 1 - P "\r" ) ^ 0 ) * EOL
```

## The main LPEG for the language Python

```

2899 local EndKeyword
2900   = Space + Punct + Delim + EOL + Beamer + DetectedCommands + Escape +
2901   EscapeMath + -1

```

First, the main loop :

```

2902 local Main =
2903   space ^ 0 * EOL -- faut-il le mettre en commentaire ?
2904   + Space
2905   + Tab
2906   + Escape + EscapeMath
2907   + Beamer
2908   + CommentLaTeX
2909   + DetectedCommands
2910   + Prompt
2911   + LongString
2912   + Comment
2913   + ExceptionInConsole
2914   + Delim
2915   + Operator
2916   + OperatorWord * EndKeyword
2917   + ShortString
2918   + Punct
2919   + FromImport
2920   + RaiseException
2921   + DefFunction
2922   + DefClass
2923   + For
2924   + Keyword * EndKeyword
2925   + Decorator
2926   + Builtin * EndKeyword
2927   + Identifier
2928   + Number
2929   + Word

```

Here, we must not put `local`, of course.

```

2930 LPEG1.python = Main ^ 0

```

We recall that each line in the Python code to parse will be sent back to LaTeX between a pair `\@@_begin_line: - \@@_end_line:`<sup>7</sup>.

```

2931 LPEG2.python =
2932 Ct (
2933   ( space ^ 0 * "\r" ) ^ -1
2934   * Lc [[ \@@_begin_line: ]]
2935   * LeadingSpace ^ 0
2936   * ( space ^ 1 * -1 + space ^ 0 * EOL + Main ) ^ 0
2937   * -1
2938   * Lc [[ \@@_end_line: ]]
2939 )

```

End of the Lua scope for the language Python.

```

2940 end

```

---

<sup>7</sup>Remember that the `\@@_end_line:` must be explicit because it will be used as marker in order to delimit the argument of the command `\@@_begin_line:`

### 3.5 The language OCaml

We open a Lua local scope for the language OCaml (of course, there will be also global definitions).

```

2941 --ocaml Ocaml OCaml
2942 do

2943 local SkipSpace = ( Q " " + EOL ) ^ 0
2944 local Space = ( Q " " + EOL ) ^ 1

2945 local braces = Compute_braces ( '\'' * ( 1 - S "\'" ) ^ 0 * '\'' )

2946 if piton.beamer then Beamer = Compute_Beamer ( 'ocaml' , braces ) end
2947 DetectedCommands =
2948   Compute_DetectedCommands ( 'ocaml' , braces )
2949   + Compute_RawDetectedCommands ( 'ocaml' , braces )
2950 local Q

```

Usually, the following version of the function Q will be used without the second arguemnt (**strict**), that is to say in a loosy way. However, in some circumstances, we will a need the “strict” version, for instance in **DefFunction**.

```

2951 function Q ( pattern, strict )
2952   if strict ~= nil then
2953     return Ct ( Cc ( luatexbase.catcodetables.CatcodeTableOther ) * C ( pattern ) )
2954   else
2955     return Ct ( Cc ( luatexbase.catcodetables.CatcodeTableOther ) * C ( pattern ) )
2956     + Beamer + DetectedCommands + EscapeMath + Escape
2957   end
2958 end

2959 local K
2960 function K ( style , pattern, strict ) return
2961   Lc ( [[ {\PitonStyle{}} ] .. style .. "}{"
2962   * Q ( pattern, strict )
2963   * Lc "}"}
2964 end

2965 local WithStyle
2966 function WithStyle ( style , pattern ) return
2967   Ct ( Cc "Open" * Cc ( [[ {\PitonStyle{}} ] .. style .. "}{"] * Cc "}" )
2968   * (pattern + Beamer + DetectedCommands + EscapeMath + Escape)
2969   * Ct ( Cc "Close" )
2970 end

```

The following LPEG corresponds to the balanced expressions (balanced according to the parenthesis). Of course, we must write  $(1 - S "()" )$  with outer parenthesis.

```

2971 local balanced_parens =
2972   P { "E" , E = ( "(" * V "E" * ")" + ( 1 - S "()" ) ) ^ 0 }

```

#### The strings of OCaml

```

2973 local ocaml_string =
2974   P "\\""
2975   *
2976   P " "
2977   +
2978   P ( ( 1 - S " \r" ) ^ 1 )
2979   +
2980   EOL -- ?
2981   ) ^ 0
2982   * P "\\""

```

```

2983 local String =
2984   WithStyle
2985     ( 'String.Long.Internal' ,
2986       Q "\""
2987       *
2988       (
2989         SpaceInString
2990         +
2991         Q ( ( 1 - S " \"\r" ) ^ 1 )
2992         +
2993         EOL
2994       ) ^ 0
2995       * Q "\""
2996     )

```

Now, the “quoted strings” of OCaml (for example `{ext|Essai|ext}`).

For those strings, we will do two consecutive analysis. First an analysis to determine the whole string and, then, an analysis for the potential visual spaces and the EOL in the string.

The first analysis require a match-time capture. For explanations about that programmation, see the paragraphe *Lua's long strings* in [www.inf.puc-rio.br/~roberto/lpeg](http://www.inf.puc-rio.br/~roberto/lpeg).

```

2996 local ext = ( R "az" + "_" ) ^ 0
2997 local open = "{" * Cg ( ext , 'init' ) * "/"
2998 local close = "/" * C ( ext ) * "}"
2999 local closeeq =
3000   Cmt ( close * Cb ( 'init' ) ,
3001         function ( s , i , a , b ) return a == b end )

```

The LPEG `QuotedStringBis` will do the second analysis.

```

3002 local QuotedStringBis =
3003   WithStyle ( 'String.Long.Internal' ,
3004     (
3005       Space
3006       +
3007       Q ( ( 1 - S " \r" ) ^ 1 )
3008       +
3009       EOL
3010     ) ^ 0 )

```

We use a “function capture” (as called in the official documentation of the LPEG) in order to do the second analysis on the result of the first one.

```

3011 local QuotedString =
3012   C ( open * ( 1 - closeeq ) ^ 0 * close ) /
3013   ( function ( s ) return QuotedStringBis : match ( s ) end )

```

In OCaml, the delimiters for the comments are (\* and \*). There are unsymmetrical and OCaml allows those comments to be nested. That's why we need a grammar.

In these comments, we embed the math comments (between \$ and \$) and we embed also a treatment for the end of lines (since the comments may be multi-lines).

```

3014 local comment =
3015   P {
3016     "A" ,
3017     A = Q "(" *
3018       * ( V "A"
3019         + Q ( ( 1 - S "\r$\\" - "(*" - "*") ) ^ 1 ) -- $
3020         + ocaml_string

```

## Some standard LPEG

```
3027 local Delim = Q ( P "[" + "/" + S "(" ) )
3028 local Punct = Q ( S ",;!" )
```

The identifiers caught by `cap_identifier` begin with a capital. In OCaml, it's used for the constructors of types and for the names of the modules.

```
3029 local cap_identifier = R "AZ" * ( R "az" + R "AZ" + S "_" + digit ) ^ 0
```

We consider `::` and `[]` as constructors (of the lists) as does the Tuareg mode of Emacs.

```
3030 local Constructor =
3031   P "::"
3032   * Lc (
3033     [[ {\PitonStyle{Name.Constructor}} ] ] ..
3034     [[{\hspace{0.1em}}:\hspace{-0.2em}:\hspace{0.1em}} ] ]
3035   )
3036   +
3037   P "[]"
3038   * Lc ([[ {\PitonStyle{Name.Constructor}}{\hspace{-0.1em}{\hspace{0.1em}}[{\hspace{0.1em}}]}} ] ]
3039   K ( 'Name.Constructor' ,
3040     Q "`" ^ -1 * cap_identifier
3041     + Q ( "[" , true ) * SkipSpace * Q ( "]" , true ) )

3042 local ModuleType = K ( 'Name.Type' , cap_identifier )

3043 local OperatorWord =
3044   K ( 'Operator.Word' ,
3045     P "asr" + "land" + "lor" + "lsl" + "lxor" + "mod" + "or" + "not" )
```

In OCaml, some keywords are considered as *governing keywords* with some special syntactic characteristics.

```
3046 local governing_keyword = P "and" + "begin" + "class" + "constraint" +
3047   "end" + "external" + "functor" + "include" + "inherit" + "initializer" +
3048   "in" + "let" + "method" + "module" + "object" + "open" + "rec" + "sig" +
3049   "struct" + "type" + "val"

3050 local Keyword =
3051   K ( 'Keyword' ,
3052     P "assert" + "as" + "done" + "downto" + "do" + "else" + "exception"
3053     + "for" + "function" + "fun" + "if" + "lazy" + "match" + "mutable"
3054     + "new" + "of" + "private" + "raise" + "then" + "to" + "try"
3055     + "virtual" + "when" + "while" + "with" )
3056   + K ( 'Keyword.Constant' , P "true" + "false" )
3057   + K ( 'Keyword.Governing' , governing_keyword )

3058 local EndKeyword
3059   = Space + Punct + Delim + EOL + Beamer + DetectedCommands + Escape
3060   + EscapeMath + -1
```

Now, the identifier. Recall that we have also a LPEG `cap_identifier` for the identifiers beginning with a capital letter.

```
3061 local identifier = ( R "az" + "_" ) * ( R "az" + R "AZ" + S "_" + digit ) ^ 0
3062   - ( OperatorWord + Keyword ) * EndKeyword
```

We have the internal style `Identifier.Internal` in order to be able to implement the mechanism `\SetPitonIdentifier`. The final user has access to a style called `Identifier`.

```
3063 local Identifier = K ( 'Identifier.Internal' , identifier )
```

In OCaml, *character* is a type different of the type `string`.

```

3064  local ocaml_char =
3065    P """
3066    (
3067      ( 1 - S "'\\\" )
3068      + "\\\" "
3069      * ( S "\\\'ntbr \""
3070        + digit * digit * digit
3071        + P "x" * ( digit + R "af" + R "AF" )
3072          * ( digit + R "af" + R "AF" )
3073          * ( digit + R "af" + R "AF" )
3074        + P "o" * R "03" * R "07" * R "07" )
3075    )
3076    * """
3077  local Char =
3078    K ( 'String.Short.Internal', ocaml_char )

```

For the parameter of the types (for example : `\\a as in `a list).

```

3079  local TypeParameter =
3080    K ( 'TypeParameter' ,
3081      "'_" * Q "_" ^ -1 * alpha ^ 1 * digit ^ 0 * ( # ( 1 - P "") + -1 ) )

```

**DotNotation** Now, we deal with the notations with points (eg: `List.length`). In OCaml, such notation is used for the fields of the records and for the modules.

```

3082  local DotNotation =
3083    (
3084      K ( 'Name.Module' , cap_identifier )
3085      * Q "."
3086      * ( Identifier + Constructor + Q "(" + Q "[" + Q "{" ) ^ -1
3087      +
3088      Identifier
3089      * Q "."
3090      * K ( 'Name.Field' , identifier )
3091    )
3092    * ( Q "." * K ( 'Name.Field' , identifier ) ) ^ 0

```

## The records

```

3093  local expression_for_fields_type =
3094    P { "E" ,
3095      E = ( "{" * V "F" * "}" "

3183 LPEG_cleaner.ocaml = Compute_LPEG_cleaner ( 'ocaml' , braces )

```

An argument in the definition of a OCaml function may be of the form `(pattern:type)`. pattern may be a single identifier but it's not mandatory. First instance, it's possible to write in OCaml:

```
let head (a::q) = a
```

First, we write a pattern (in the LPEG sens!) to match what will be the pattern (in the OCaml sens).

```

3184 local pattern_part =
3185   ( P "(" * balanced_parens * ")" + ( 1 - S ":()" ) + P ":::" ) ^ 0

```

For the “type” part, the LPEG-pattern will merely be `balanced_parens`.

We can now write a LPEG Argument which catches a argument of function (in the definition of the function).

```
3186 local Argument =
```

The following line is for the labels of the labeled arguments. Maybe we will, in the future, create a style for those elements.

```

3187   ( Q "~" * Identifier * Q ":" * SkipSpace ) ^ -1
3188   *

```

Now, the argument itself, either a single identifier, or a construction between parentheses

```

3189   (
3190     K ( 'Identifier.Internal' , identifier )
3191     +
3192     Q "(" * SkipSpace
3193     * ( C ( pattern_part ) / ParseAgain )
3194     * SkipSpace

```

Of course, the specification of type is optional.

```

3195   * ( Q ":" * #(1- P"=")
3196     * K ( 'TypeExpression' , balanced_parens ) * SkipSpace
3197     ) ^ -1
3198   * Q ")"
3199   )

```

Despite its name, then LPEG DefFunction deals also with `let open` which opens locally a module.

```

3200 local DefFunction =
3201   K ( 'Keyword.Governing' , "let open" )
3202   * Space
3203   * K ( 'Name.Module' , cap_identifier )
3204   +
3205   K ( 'Keyword.Governing' , P "let rec" + "let" + "and" )

```

```

3206      * Space
3207      * K ( 'Name.Function.Internal' , identifier )
3208      * Space
3209      *

```

We use here the argument `strict` in order to allow a correct analyse of `let x = \uncover<2->{y}` (elsewhere, it's interpreted as a definition of a OCaml function).

```

3210      Q "=" * SkipSpace * K ( 'Keyword' , "function" , true )
3211      +
3212      Argument * ( SkipSpace * Argument ) ^ 0
3213      *
3214      SkipSpace
3215      * Q ":" * # ( 1 - P "=" )
3216      * K ( 'TypeExpression' , ( 1 - P "=" ) ^ 0 )
3217      ) ^ -1
3218

```

## DefModule

```

3353  )

```

End of the Lua scope for the language OCaml.

```
3354 end
```

## 3.6 The language C

We open a Lua local scope for the language C (of course, there will be also global definitions).

```

3355 --c C c++ C++
3356 do
```

```

3357 local Delim = Q ( S "{[()]}")
3358 local Punct = Q ( S ",:;!")
```

Some strings of length 2 are explicit because we want the corresponding ligatures available in some fonts such as *Fira Code* to be active.

```

3359 local identifier = letter * alphanum ^ 0
3360
3361 local Operator =
3362   K ( 'Operator' ,
3363     P "!=" + "==" + "<<" + ">>" + "<=" + ">=" + "|/" + "&&"
3364     + S "-~+/*%=<>&.@|!" )
3365
3366 local Keyword =
3367   K ( 'Keyword' ,
3368     P "alignas" + "asm" + "auto" + "break" + "case" + "catch" + "class" +
3369     "const" + "constexpr" + "continue" + "decltype" + "do" + "else" + "enum" +
3370     "extern" + "for" + "goto" + "if" + "nexcept" + "private" + "public" +
3371     "register" + "restricted" + "return" + "static" + "static_assert" +
3372     "struct" + "switch" + "thread_local" + "throw" + "try" + "typedef" +
3373     "union" + "using" + "virtual" + "volatile" + "while"
3374   )
3375   + K ( 'Keyword.Constant' , P "default" + "false" + "NULL" + "nullptr" + "true" )
3376
3377 local Builtin =
3378   K ( 'Name.Builtin' ,
3379     P "alignof" + "malloc" + "printf" + "scanf" + "sizeof" )
3380
3381 local Type =
3382   K ( 'Name.Type' ,
3383     P "bool" + "char" + "char16_t" + "char32_t" + "double" + "float" +
3384     "int8_t" + "int16_t" + "int32_t" + "int64_t" + "uint8_t" + "uint16_t" +
3385     "uint32_t" + "uint64_t" + "int" + "long" + "short" + "signed" + "unsigned" +
3386     "void" + "wchar_t" ) * Q "*" ^ 0
3387
3388 local DefFunction =
3389   Type
3390   * Space
3391   * Q "*" ^ -1
3392   * K ( 'Name.Function.Internal' , identifier )
3393   * SkipSpace
3394   * # P "("

```

We remind that the marker # of LPEG specifies that the pattern will be detected but won't consume any character.

The following LPEG **DefClass** will be used to detect the definition of a new class (the name of that new class will be formatted with the piton style `Name.Class`).

Example: `class myclass:`

```

3395 local DefClass =
3396   K ( 'Keyword' , "class" ) * Space * K ( 'Name.Class' , identifier )

```

If the word `class` is not followed by a identifier, it will be caught as keyword by the LPEG **Keyword** (useful if we want to type a list of keywords).

```

3397 local Character =
3398   K ( 'String.Short' ,
3399     P [['\''']] + P """ * ( 1 - P ''' ) ^ 0 * P ''' )

```

## The strings of C

```

3400 String =
3401   WithStyle ( 'String.Long.Internal' ,
3402     Q "\""
3403     * ( SpaceInString
3404       + K ( 'String.Interpol' ,

```

```

3405         "%" * ( S "difcspxXou" + "ld" + "li" + "hd" + "hi" )
3406         )
3407         + Q ( ( P "\\" + 1 - S " \\" ) ^ 1 )
3408         ) ^ 0
3409         * Q "\\" "
3410     )

```

**Beamer** The argument of Compute\_braces must be a pattern which does no catching corresponding to the strings of the language.

```

3411 local braces = Compute_braces ( "\\" * ( 1 - S "\\" ) ^ 0 * "\\" )
3412 if piton.beamer then Beamer = Compute_Beamer ( 'c' , braces ) end
3413 DetectedCommands =
3414   Compute_DetectedCommands ( 'c' , braces )
3415   + Compute_RawDetectedCommands ( 'c' , braces )
3416 LPEG_cleaner.c = Compute_LPEG_cleaner ( 'c' , braces )

```

### The directives of the preprocessor

```

3417 local Preproc = K ( 'Preproc' , "#" * ( 1 - P "\r" ) ^ 0 ) * ( EOL + -1 )

```

**The comments in the C listings** We define different LPEG dealing with comments in the C listings.

```

3418 local Comment =
3419   WithStyle ( 'Comment.Internal' ,
3420     Q("//" * ( CommentMath + Q ( ( 1 - S "$\r" ) ^ 1 ) ) ^ 0 ) -- $
3421     * ( EOL + -1 )
3422
3423 local LongComment =
3424   WithStyle ( 'Comment.Internal' ,
3425     Q("/*"
3426       * ( CommentMath + Q ( ( 1 - P "*/" - S "$\r" ) ^ 1 ) + EOL ) ^ 0
3427       * Q "*/"
3428     ) -- $

```

### The main LPEG for the language C

```

3429 local EndKeyword
3430   = Space + Punct + Delim + EOL + Beamer + DetectedCommands + Escape +
3431   EscapeMath + -1

```

First, the main loop :

```

3432 local Main =
3433   space ^ 0 * EOL
3434   + Space
3435   + Tab
3436   + Escape + EscapeMath
3437   + CommentLaTeX
3438   + Beamer
3439   + DetectedCommands
3440   + Preproc
3441   + Comment + LongComment
3442   + Delim
3443   + Operator
3444   + Character
3445   + String
3446   + Punct

```

```

3447      + DefFunction
3448      + DefClass
3449      + Type * ( Q "*" ^ -1 + EndKeyword )
3450      + Keyword * EndKeyword
3451      + Builtin * EndKeyword
3452      + Identifier
3453      + Number
3454      + Word

```

Here, we must not put `local`, of course.

```
3455     LPEG1.c = Main ^ 0
```

We recall that each line in the C code to parse will be sent back to LaTeX between a pair `\@_begin_line: - @_end_line:`<sup>8</sup>.

```

3456     LPEG2.c =
3457     Ct (
3458         ( space ^ 0 * P "\r" ) ^ -1
3459         * Lc [[ @_begin_line: ]]
3460         * LeadingSpace ^ 0
3461         * ( space ^ 1 * -1 + space ^ 0 * EOL + Main ) ^ 0
3462         * -1
3463         * Lc [[ @_end_line: ]]
3464     )

```

End of the Lua scope for the language C.

```
3465 end
```

## 3.7 The language SQL

We open a Lua local scope for the language SQL (of course, there will be also global definitions).

```

3466 --sql SQL
3467 do

3468     local LuaKeyword
3469     function LuaKeyword ( name ) return
3470         Lc [[ {\PitonStyle{Keyword}\} ]]
3471         * Q ( Cmt (
3472             C ( letter * alphanum ^ 0 ) ,
3473             function ( _ , _ , a ) return a : upper ( ) == name end
3474         )
3475     )
3476     * Lc "}""
3477 end

```

In the identifiers, we will be able to catch those containing spaces, that is to say like `"last name"`.

```

3478     local identifier =
3479         letter * ( alphanum + "-" ) ^ 0
3480         + P '!' * ( ( 1 - P '!' ) ^ 1 ) * '!'
3481     local Operator =
3482         K ( 'Operator' , P "=" + "!=" + "<>" + ">=" + ">" + "<=" + "<" + S "*+/" )

```

---

<sup>8</sup>Remember that the `\@_end_line:` must be explicit because it will be used as marker in order to delimit the argument of the command `\@_begin_line:`

In SQL, the keywords are case-insensitive. That's why we have a little complication. We will catch the keywords with the identifiers and, then, distinguish the keywords with a Lua function. However, some keywords will be caught in special LPEG because we want to detect the names of the SQL tables.

The following function converts a comma-separated list in a “set”, that is to say a Lua table with a fast way to test whether a string belongs to that set (eventually, the indexation of the components of the table is no longer done by integers but by the strings themselves).

```
3483 local Set
3484 function Set ( list )
3485     local set = { }
3486     for _, l in ipairs ( list ) do set[l] = true end
3487     return set
3488 end
```

We now use the previous function `Set` to creates the “sets” `set_keywords` and `set_builtin`. That list of keywords comes from [https://sqlite.org/lang\\_keywords.html](https://sqlite.org/lang_keywords.html).

```
3489 local set_keywords = Set
3490 {
3491     "ABORT", "ACTION", "ADD", "AFTER", "ALL", "ALTER", "ALWAYS", "ANALYZE",
3492     "AND", "AS", "ASC", "ATTACH", "AUTOINCREMENT", "BEFORE", "BEGIN", "BETWEEN",
3493     "BY", "CASCADE", "CASE", "CAST", "CHECK", "COLLATE", "COLUMN", "COMMIT",
3494     "CONFLICT", "CONSTRAINT", "CREATE", "CROSS", "CURRENT", "CURRENT_DATE",
3495     "CURRENT_TIME", "CURRENT_TIMESTAMP", "DATABASE", "DEFAULT", "DEFERRABLE",
3496     "DEFERRED", "DELETE", "DESC", "DETACH", "DISTINCT", "DO", "DROP", "EACH",
3497     "ELSE", "END", "ESCAPE", "EXCEPT", "EXCLUDE", "EXCLUSIVE", "EXISTS",
3498     "EXPLAIN", "FAIL", "FILTER", "FIRST", "FOLLOWING", "FOR", "FOREIGN", "FROM",
3499     "FULL", "GENERATED", "GLOB", "GROUP", "GROUPS", "HAVING", "IF", "IGNORE",
3500     "IMMEDIATE", "IN", "INDEX", "INDEXED", "INITIALLY", "INNER", "INSERT",
3501     "INSTEAD", "INTERSECT", "INTO", "IS", "ISNULL", "JOIN", "KEY", "LAST",
3502     "LEFT", "LIKE", "LIMIT", "MATCH", "MATERIALIZED", "NATURAL", "NO", "NOT",
3503     "NOTHING", "NOTNULL", "NULL", "NULLS", "OF", "OFFSET", "ON", "OR", "ORDER",
3504     "OTHERS", "OUTER", "OVER", "PARTITION", "PLAN", "PRAGMA", "PRECEDING",
3505     "PRIMARY", "QUERY", "RAISE", "RANGE", "RECURSIVE", "REFERENCES", "REGEXP",
3506     "REINDEX", "RELEASE", "RENAME", "REPLACE", "RESTRICT", "RETURNING", "RIGHT",
3507     "ROLLBACK", "ROW", "ROWS", "SAVEPOINT", "SELECT", "SET", "TABLE", "TEMP",
3508     "TEMPORARY", "THEN", "TIES", "TO", "TRANSACTION", "TRIGGER", "UNBOUNDED",
3509     "UNION", "UNIQUE", "UPDATE", "USING", "VACUUM", "VALUES", "VIEW", "VIRTUAL",
3510     "WHEN", "WHERE", "WINDOW", "WITH", "WITHOUT"
3511 }
3512 local set_builtins = Set
3513 {
3514     "AVG" , "COUNT" , "CHAR_LENGTH" , "CONCAT" , "CURDATE" , "CURRENT_DATE" ,
3515     "DATE_FORMAT" , "DAY" , "LOWER" , "LTRIM" , "MAX" , "MIN" , "MONTH" , "NOW" ,
3516     "RANK" , "ROUND" , "RTRIM" , "SUBSTRING" , "SUM" , "UPPER" , "YEAR"
3517 }
```

The LPEG `Identifier` will catch the identifiers of the fields but also the keywords and the built-in functions of SQL. It will *not* catch the names of the SQL tables.

```
3518 local Identifier =
3519     C ( identifier ) /
3520     (
3521         function ( s )
3522             if set_keywords [ s : upper ( ) ] then return
```

Remind that, in Lua, it's possible to return *several* values.

```
3523     { {[{\PitonStyle{Keyword}}]} } ,
3524     { luatexbase.catcodetables.other , s } ,
3525     { "}" }
3526     else
3527         if set_builtins [ s : upper ( ) ] then return
3528             { {[{\PitonStyle{Name.Builtin}}]} } ,
```

```

3529     { luatexbase.catcodetables.other , s } ,
3530     { "}" }
3531   else return
3532     { {[{\PitonStyle{Name.Field}{}]}] } ,
3533     { luatexbase.catcodetables.other , s } ,
3534     { "}" }
3535   end
3536 end
3537 end
3538 )

```

## The strings of SQL

```

3539 local String = K ( 'String.Long.Internal' , ""'' * ( 1 - P ""'' ) ^ 1 * ""'' )

```

**Beamer** The argument of Compute\_braces must be a pattern *which does no catching* corresponding to the strings of the language.

```

3540 local braces = Compute_braces ( ""'' * ( 1 - P ""'' ) ^ 1 * ""'' )
3541 if piton.beamer then Beamer = Compute_Beamer ( 'sql' , braces ) end
3542 DetectedCommands =
3543   Compute_DetectedCommands ( 'sql' , braces )
3544   + Compute_RawDetectedCommands ( 'sql' , braces )
3545 LPEG_cleaner.sql = Compute_LPEG_cleaner ( 'sql' , braces )

```

**The comments in the SQL listings** We define different LPEG dealing with comments in the SQL listings.

```

3546 local Comment =
3547   WithStyle ( 'Comment.Internal' ,
3548     Q "--" -- syntax of SQL92
3549     * ( CommentMath + Q ( ( 1 - S "$\r" ) ^ 1 ) ) ^ 0 ) -- $
3550     * ( EOL + -1 )
3551
3552 local LongComment =
3553   WithStyle ( 'Comment.Internal' ,
3554     Q "/*"
3555     * ( CommentMath + Q ( ( 1 - P "*/" - S "$\r" ) ^ 1 ) + EOL ) ^ 0
3556     * Q "*/"
3557   ) -- $

```

## The main LPEG for the language SQL

```

3558 local EndKeyword
3559   = Space + Punct + Delim + EOL + Beamer + DetectedCommands + Escape +
3560   EscapeMath + -1
3561
3562 local TableField =
3563   K ( 'Name.Table' , identifier )
3564   * Q "."
3565   * ( DetectedCommands + ( K ( 'Name.Field' , identifier ) ) ^ 0 )
3566
3567 local OneField =
3568   (
3569     Q ( "(" * ( 1 - P ")" ) ^ 0 * ")" )
3570     +
3571       K ( 'Name.Table' , identifier )
3572     * Q "."

```

```

3572     * K ( 'Name.Field' , identifier )
3573     +
3574     K ( 'Name.Field' , identifier )
3575   )

3584   Space
3585   * LuaKeyword "AS"
3586   * Space
3587   * K ( 'Name.Table' , identifier )
3588   ) ^ -1
3589
3590 local WeCatchTableNames =
3591   LuaKeyword "FROM"
3592   * ( Space + EOL )
3593   * OneTable * ( SkipSpace * Q "," * SkipSpace * OneTable ) ^ 0
3594   +
3595   LuaKeyword "JOIN" + LuaKeyword "INTO" + LuaKeyword "UPDATE"
3596   + LuaKeyword "TABLE"
3597   )
3598   * ( Space + EOL ) * OneTable
3599
3600 local EndKeyword
3601   = Space + Punct + Delim + EOL + Beamer
3602     + DetectedCommands + Escape + EscapeMath + -1

```

First, the main loop :

```

3602 local Main =
3603   space ^ 0 * EOL
3604   +
3605   Space
3606   +
3607   Tab
3608   +
3609   Escape + EscapeMath
3610   +
3611   CommentLaTeX
3612   +
3613   Beamer
3614   +
3615   DetectedCommands
3616   +
3617   Comment + LongComment
3618   +
3619   Delim
3620   +
3621   Operator
3622   +
3623   String
3624   +
3625   Punct
3626   +
3627   WeCatchTableNames
3628   +
3629   ( TableField + Identifier ) * ( Space + Operator + Punct + Delim + EOL + -1 )
3630   +
3631   Number
3632   +
3633   Word

```

Here, we must not put `local`, of course.

```
3619 LPEG1.sql = Main ^ 0
```

We recall that each line in the code to parse will be sent back to LaTeX between a pair `\@@_begin_line:` – `\@@_end_line:`<sup>9</sup>.

```

3620 LPEG2.sql =
3621 Ct (
3622   ( space ^ 0 * "\r" ) ^ -1

```

---

<sup>9</sup>Remember that the `\@@_end_line:` must be explicit because it will be used as marker in order to delimit the argument of the command `\@@_begin_line:`

```

3623     * Lc [[ @@_begin_line: ]]
3624     * LeadingSpace ^ 0
3625     * ( space ^ 1 * -1 + space ^ 0 * EOL + Main ) ^ 0
3626     * -1
3627     * Lc [[ @@_end_line: ]]
3628 )

```

End of the Lua scope for the language SQL.

```
3629 end
```

### 3.8 The language “Minimal”

We open a Lua local scope for the language “Minimal” (of course, there will be also global definitions).

```

3630 --minimal Minimal
3631 do
3632     local Punct = Q ( S ",:;!\\\" )
3633
3634     local Comment =
3635         WithStyle ( 'Comment.Internal' ,
3636             Q "#"
3637             * ( CommentMath + Q ( ( 1 - S "$\r" ) ^ 1 ) ) ^ 0 -- $
3638         )
3639         * ( EOL + -1 )
3640
3641     local String =
3642         WithStyle ( 'String.Short.Internal' ,
3643             Q "\\""
3644             * ( SpaceInString
3645                 + Q ( ( P [[\]] ] + 1 - S " \\" ) ^ 1 )
3646             ) ^ 0
3647             * Q "\\""
3648         )

```

The argument of `Compute_braces` must be a pattern which does no catching corresponding to the strings of the language.

```

3649     local braces = Compute_braces ( P "\\" * ( P "\\\" + 1 - P "\\" ) ^ 1 * "\\" )
3650
3651     if piton.beamer then Beamer = Compute_Beamer ( 'minimal' , braces ) end
3652
3653     DetectedCommands =
3654         Compute_DetectedCommands ( 'minimal' , braces )
3655         + Compute_RawDetectedCommands ( 'minimal' , braces )
3656
3657     LPEG_cleaner.minimal = Compute_LPEG_cleaner ( 'minimal' , braces )
3658
3659     local identifier = letter * alphanum ^ 0
3660
3661     local Identifier = K ( 'Identifier.Internal' , identifier )
3662
3663     local Delim = Q ( S "{[()]}")
3664
3665     local Main =
3666         space ^ 0 * EOL
3667         + Space
3668         + Tab
3669         + Escape + EscapeMath
3670         + CommentLaTeX
3671         + Beamer
3672         + DetectedCommands
3673         + Comment
3674         + Delim

```

```

3675     + String
3676     + Punct
3677     + Identifier
3678     + Number
3679     + Word

```

Here, we must not put local, of course.

```

3680     LPEG1.minimal = Main ^ 0
3681
3682     LPEG2.minimal =
3683     Ct (
3684         ( space ^ 0 * "\r" ) ^ -1
3685         * Lc [[ \@@_begin_line: ]]
3686         * LeadingSpace ^ 0
3687         * ( space ^ 1 * -1 + space ^ 0 * EOL + Main ) ^ 0
3688         * -1
3689         * Lc [[ \@@_end_line: ]]
3690     )

```

End of the Lua scope for the language “Minimal”.

```
3691 end
```

### 3.9 The language “Verbatim”

We open a Lua local scope for the language “Verbatim” (of course, there will be also global definitions).

```

3692 --verbatim Verbatim
3693 do

```

Here, we don’t use braces as done with the other languages because we don’t have have to take into account the strings (there is no string in the language “Verbatim”).

```

3694     local braces =
3695         P { "E" ,
3696             E = ( "{" * V "E" * "}" + ( 1 - S "{}" ) ) ^ 0
3697         }
3698
3699     if piton.beamer then Beamer = Compute_Beamer ( 'verbatim' , braces ) end
3700
3701     DetectedCommands =
3702         Compute_DetectedCommands ( 'verbatim' , braces )
3703         + Compute_RawDetectedCommands ( 'verbatim' , braces )
3704
3705     LPEG_cleaner.verbatim = Compute_LPEG_cleaner ( 'verbatim' , braces )

```

Now, you will construct the LPEG Word.

```

3706     local lpeg_central = 1 - S " \\r"
3707     if piton.begin_escape then
3708         lpeg_central = lpeg_central - piton.begin_escape
3709     end
3710     if piton.begin_escape_math then
3711         lpeg_central = lpeg_central - piton.begin_escape_math
3712     end
3713     local Word = Q ( lpeg_central ^ 1 )
3714
3715     local Main =
3716         space ^ 0 * EOL
3717         + Space
3718         + Tab
3719         + Escape + EscapeMath
3720         + Beamer
3721         + DetectedCommands
3722         + Q [[\]]
3723         + Word

```

Here, we must not put `local`, of course.

```

3724 LPEG1.verbatim = Main ^ 0
3725
3726 LPEG2.verbatim =
3727 Ct (
3728     ( space ^ 0 * "\r" ) ^ -1
3729     * Lc [[ \@@_begin_line: ]]
3730     * LeadingSpace ^ 0
3731     * ( space ^ 1 * -1 + space ^ 0 * EOL + Main ) ^ 0
3732     * -1
3733     * Lc [[ \@@_end_line: ]]
3734 )

```

End of the Lua scope for the language “`verbatim`”.

```
3735 end
```

### 3.10 The language `expl`

We open a Lua local scope for the language `expl` of LaTeX3 (of course, there will be also global definitions).

```

3736 --EXPL expl
3737 do
3738     local Comment =
3739         WithStyle
3740         ( 'Comment.Internal' ,
3741             Q "%" * ( CommentMath + Q ( ( 1 - S "$\r" ) ^ 1 ) ) ^ 0 -- $
3742         )
3743     * ( EOL + -1 )

```

First, we begin with a special function to analyse the “keywords”, that is to say the control sequences beginning by “`\`”.

```

3744     local analyze_cs
3745     function analyze_cs ( s )
3746         local i = s : find ( ":" )
3747         if i then

```

First, the case of what might be called a “function” in `expl`, for instance, `\tl_set:Nn` or `\int_compare:nNnTF`.

```

3748         local name = s : sub ( 2 , i - 1 )
3749         local parts = name : explode ( "_" )
3750         local module = parts[1]
3751         if module == "" then module = parts[3] end

```

Remind that, in Lua, we can return *several* values.

```

3752     return
3753     { {[f\OptionalLocalPitonStyle{Module.}] .. module .. "}{"} ,
3754     { luatexbase.catcodetables.other , s } ,
3755     { "}}"
3756   else
3757     local p = s : sub ( 1 , 3 )
3758     if p == {[l_]} or p == {[g_]} or p == {[c_]} then

```

The case of what might be called a “variable”, for instance, `\l_tmpa_int` or `\g__module_text_tl`.

```

3759     local scope = s : sub(2,2)
3760     local parts = s : explode ( "_" )
3761     local module = parts[2]
3762     if module == "" then module = parts[3] end
3763     local type = parts[#parts]
3764     return
3765     { {[f\OptionalLocalPitonStyle{Scope.}] .. scope .. "}{"} ,
3766     { {[f\OptionalLocalPitonStyle{Module.}] .. module .. "}{"} ,
3767     { {[f\OptionalLocalPitonStyle{Type.}] .. type .. "}{"} ,

```

```

3768     { luatexbase.catcodetables.other , s } ,
3769     { "}}}}}}" }
3770 else
3771     return { luatexbase.catcodetables.other , s }
3772 end
3773 end
3774 end

```

We have a control sequence which is neither a “function” neither a “variable” of `expl`. It’s a control sequence of standard LaTeX and we don’t format it.

```
3771     return { luatexbase.catcodetables.other , s }
```

```
3772 end
```

```
3773 end
```

```
3774 end
```

Here, we don’t use **braces** as done with the other languages because we don’t have have to take into account the strings (there is no string in the language `expl`).

```

3775 local braces =
3776   P { "E" ,
3777     E = ( "{ " * V "E" * "}" + ( 1 - S "{}" ) ) ^ 0
3778   }
3779
3780 if piton.beamer then Beamer = Compute_Beamer ( 'expl' , braces ) end
3781
3782 DetectedCommands =

3803 local Word = Q ( ( 1 - S "\r" ) ^ 1 )
3804
3805 local Main =
3806   space ^ 0 * EOL
3807   + Space
3808   + Tab
3809   + Escape + EscapeMath
3810   + Beamer
3811   + Comment
3812   + DetectedCommands
3813   + DefFunction
3814   + ControlSequence
3815   + Word

```

Here, we must not put `local`, of course.

```
3813 LPEG1.expl = Main ^ 0
```

```
3814
3815 LPEG2.expl =
```

```
3816 Ct (
```

```
3817   ( space ^ 0 * "\r" ) ^ -1
```

```
3818   * Lc [[ \@@_begin_line: ]]
```

```
3819   * LeadingSpace ^ 0
```

```
3820   * ( space ^ 1 * -1 + space ^ 0 * EOL + Main ) ^ 0
```

```

3821      * -1
3822      * Lc [[ \@@_end_line: ]]
3823  )

```

End of the Lua scope for the language `expl` of LaTeX3.

```
3824 end
```

### 3.11 The function Parse

The function `Parse` is the main function of the package `piton`. It parses its argument and sends back to LaTeX the code with interlaced formatting LaTeX instructions. In fact, everything is done by the LPEG corresponding to the considered language (`LPEG2[language]`) which returns as capture a Lua table containing data to send to LaTeX.

```
3825 function piton.Parse ( language , code )
```

The variable `piton.language` will be used by the function `ParseAgain`.

```

3826  piton.language = language
3827  local t = LPEG2[language] : match ( code )
3828  if not t then
3829      sprintL3 [[ \@@_error_or_warning:n { SyntaxError } ]]
3830  return -- to exit in force the function
3831 end
3832 local left_stack = {}
3833 local right_stack = {}
3834 for _ , one_item in ipairs ( t ) do
3835  if one_item == "EOL" then
3836      for i = #right_stack, 1, -1 do
3837          tex.print ( right_stack[i] )
3838      end

```

We remind that the `\@@_end_line:` must be explicit since it's the marker of end of the command `\@@_begin_line:`.

```

3839      sprintL3 ( [[ \@@_end_line: \@@_par: \@@_begin_line: ]] )
3840      tex.print ( table.concat ( left_stack ) )
3841 else

```

Here is an example of an item beginning with "Open".

```
{ "Open" , "\begin{uncoverenv}<2>" , "\end{uncoverenv}" }
```

In order to deal with the ends of lines, we have to close the environment (`\begin{uncoverenv}` in this example) at the end of each line and reopen it at the beginning of the new line. That's why we use two Lua stacks, called `left_stack` and `right_stack`. `left_stack` will be for the elements like `\begin{uncoverenv}<2>` and `right_stack` will be for the elements like `\end{uncoverenv}`.

```

3842 if one_item[1] == "Open" then
3843     tex.print ( one_item[2] )
3844     table.insert ( left_stack , one_item[2] )
3845     table.insert ( right_stack , one_item[3] )
3846 else
3847     if one_item[1] == "Close" then
3848         tex.print ( right_stack[#right_stack] )
3849         left_stack[#left_stack] = nil
3850         right_stack[#right_stack] = nil
3851     else
3852         tex.tprint ( one_item )
3853     end
3854 end
3855 end
3856 end
3857 end

```

There is the problem of the conventions of end of lines (\n in Unix and Linux but \r\n in Windows). The function `my_file_lines` will read a file line by line after replacement of the potential \r\n by \n (that means that we go the convention UNIX).

```

3858 local my_file_lines
3859 function my_file_lines ( filename )
3860     local f = io.open ( filename , 'rb' )
3861     local s = f : read ( '*a' )
3862     f : close ( )
3863     return ( s .. '\n' ) : gsub( '\r\n?' , '\n' ) : gmatch ( '(.-)\n' )
3864 end

```

À la fin, on doit bien mettre (.-) et pas (\*.\*)�

```

3863     return ( s .. '\n' ) : gsub( '\r\n?' , '\n' ) : gmatch ( '(.-)\n' )
3864 end

```

Recall that, in Lua, `gmatch` returns an *iterator*.

```

3865 function piton.ReadFile ( name , first_line , last_line )
3866     local s = ''
3867     local i = 0
3868     for line in my_file_lines ( name ) do
3869         i = i + 1
3870         if i >= first_line then
3871             s = s .. '\r' .. line
3872         end
3873         if i >= last_line then break end
3874     end

```

We extract the BOM of utf-8, if present.

```

3875     if s : sub ( 1 , 4 ) == string.char ( 13 , 239 , 187 , 191 ) then
3876         s = s : sub ( 5 , -1 )
3877     end
3878     sprintL3 ( [[ \tl_set:Nn \l_@@_listing_tl { } ]])
3879     tex.print ( luatexbase.catcodetables.other , s )
3880     sprintL3 ( "}" )
3881 end

3882 function piton.RetrieveGobbleParse ( lang , n , splittable , code )
3883     local s
3884     s = ( ( P " " ^ 0 * "\r" ) ^ -1 * C ( P ( 1 ) ^ 0 ) * -1 ) : match ( code )
3885     piton.GobbleParse ( lang , n , splittable , s )
3886 end

```

### 3.12 Two variants of the function Parse with integrated preprocessors

The following command will be used by the user command `\piton`. For that command, we have to undo the duplication of the symbols #.

```

3887 function piton.ParseBis ( lang , code )
3888     return piton.Parse ( lang , code : gsub ( '##' , '#' ) )
3889 end

```

Of course, `gsub` spans the string only once for the substitutions, which means that ##### will be replaced by ## as expected and not by #.

The following command will be used when we have to parse some small chunks of code that have yet been parsed. They are re-scanned by LaTeX because it has been required by `\@@_piton:n` in the `piton` style of the syntactic element. In that case, you have to remove the potential `\@@_breakable_space:` that have been inserted when the key `break-lines` is in force.

```

3890 function piton.ParseTer ( lang , code )

```

Be careful: we have to write `[[\@@_breakable_space: ]]` with a space after the name of the LaTeX command `\@@_breakable_space::`.

```
3891   return piton.Parse
3892     (
3893       lang ,
3894       code : gsub ( [[\@@_breakable_space: ]] , ' ' )
3895     )
3896 end
```

### 3.13 Preprocessors of the function Parse for gobble

We deal now with preprocessors of the function `Parse` which are needed when the “gobble mechanism” is used.

The following LPEG returns as capture the minimal number of spaces at the beginning of the lines of code.

```
3897 local AutoGobbleLPEG =
3898   ( (
3899     P " " ^ 0 * "\r"
3900     +
3901     Ct ( C " " ^ 0 ) / table.getn
3902     * ( 1 - P " " ) * ( 1 - P "\r" ) ^ 0 * "\r"
3903   ) ^ 0
3904   * ( Ct ( C " " ^ 0 ) / table.getn
3905     * ( 1 - P " " ) * ( 1 - P "\r" ) ^ 0 ) ^ -1
3906   ) / math.min
```

The following LPEG is similar but works with the tabulations.

```
3907 local TabsAutoGobbleLPEG =
3908   (
3909     (
3910       P "\t" ^ 0 * "\r"
3911       +
3912       Ct ( C "\t" ^ 0 ) / table.getn
3913       * ( 1 - P "\t" ) * ( 1 - P "\r" ) ^ 0 * "\r"
3914     ) ^ 0
3915     * ( Ct ( C "\t" ^ 0 ) / table.getn
3916       * ( 1 - P "\t" ) * ( 1 - P "\r" ) ^ 0 ) ^ -1
3917   ) / math.min
```

The following LPEG returns as capture the number of spaces at the last line, that is to say before the `\end{Piton}` (and usually it's also the number of spaces before the corresponding `\begin{Piton}` because that's the traditional way to indent in LaTeX).

```
3918 local EnvGobbleLPEG =
3919   ( ( 1 - P "\r" ) ^ 0 * "\r" ) ^ 0
3920   * Ct ( C " " ^ 0 * -1 ) / table.getn
```

The function `gobble` gobbles  $n$  characters on the left of the code. The negative values of  $n$  have special significations.

```
3921 function piton.Gobble ( n , code )
3922   if n == 0 then return
3923   code
3924 else
3925   if n == -1 then
3926     n = AutoGobbleLPEG : match ( code )
```

for the case of an empty environment (only blank lines)

```

3927     if tonumber(n) then else n = 0 end
3928   else
3929     if n == -2 then
3930       n = EnvGobbleLPEG : match ( code )
3931     else
3932       if n == -3 then
3933         n = TabsAutoGobbleLPEG : match ( code )
3934         if tonumber(n) then else n = 0 end
3935       end
3936     end
3937   end

```

We have a second test `if n == 0` because, even if the key like `auto-gobble` is in force, it's possible that, in fact, there is no space to gobble...

```

3938   if n == 0 then return
3939     code
3940   else return

```

We will now use a LPEG that we have to compute dynamically because it depends on the value of `n`.

```

3941   ( Ct (
3942     ( 1 - P "\r" ) ^ (-n) * C ( ( 1 - P "\r" ) ^ 0 )
3943     * ( C "\r" * ( 1 - P "\r" ) ^ (-n) * C ( ( 1 - P "\r" ) ^ 0 )
3944     ) ^ 0 )
3945     / table.concat
3946   ) : match ( code )
3947 end
3948 end
3949 end

```

In the following code, `n` is the value of `\l_@@_gobble_int`.  
`splittable` is the value of `\l_@@_splittable_int`.

```

3950 function piton.GobbleParse ( lang , n , splittable , code )
3951   piton.ComputeLinesStatus ( code , splittable )
3952   piton.last_code = piton.Gobble ( n , code )
3953   piton.last_language = lang

```

We count the number of lines of the computer listing. The result will be stored by Lua in `\g_@@_nb_lines_int`.

```

3954   piton.CountLines ( piton.last_code )
3955   piton.Parse ( lang , piton.last_code )
3956   piton.join_and_write ( )
3957 end

```

The following function will be used when the end user has used the key `join` or the key `write`. The value of the key `join` has been written in the Lua variable `piton.join`.

```

3958 function piton.join_and_write ( )
3959   if piton.join ~= '' then
3960     if not piton.join_files [ piton.join ] then
3961       piton.join_files [ piton.join ] = piton.get_last_code ( )
3962     else
3963       piton.join_files [ piton.join ] =
3964         piton.join_files [ piton.join ] .. "\r\n" .. piton.get_last_code ( )
3965     end
3966   end

```

Now, if the end user has used the key `write` to write the listing of the environment on an external file (on the disk).

We have written the values of the keys `write` and `path-write` in the Lua variables `piton.write` and `piton.path-write`.

If `piton.write` is not empty, that means that the key `write` has been used for the current environment and, hence, we have to write the content of the listing on the corresponding external file.

```

3967   if piton.write ~= '' then

```

We will write on `file_name` the full name (with the path) of the file in which we will write.

```
3968 local file_name = ''
3969 if piton.path_write == '' then
3970   file_name = piton.write
3971 else
```

If `piton.path-write` is not empty, that means that we will not write on a file in the current directory but in another directory. First, we verify that that directory actually exists.

```
3972 local attr = lfs.attributes ( piton.path_write )
3973 if attr and attr.mode == "directory" then
3974   file_name = piton.path_write .. "/" .. piton.write
3975 else
```

If the directory does *not* exist, you raise an (non-fatal) error since TeX is not able to create a new directory.

```
3976 sprintL3 [[ \@@_error_or_warning:n { InexistentDirectory } ]]
3977 end
3978 end
3979 if file_name ~= '' then
```

Now, `file_name` contains the complete name of the file on which we will have to write. Maybe the file does not exist but we are sure that the directory exist.

The Lua table `piton.write_files` is a table of Lua strings corresponding to all the files that we will write on the disk in the `\AtEndDocument`. They correspond to the use of the key `write` (and `path-write`).

```
3980 if not piton.write_files [ file_name ] then
3981   piton.write_files [ file_name ] = piton.get_last_code ( )
3982 else
3983   piton.write_files [ file_name ] =
3984   piton.write_files [ file_name ] .. "\n" .. piton.get_last_code ( )
3985 end
3986 end
3987 end
3988 end
```

The following command will be used when the end user has set `print=false`.

```
3989 function piton.GobbleParseNoPrint ( lang , n , code )
3990   piton.last_code = piton.Gobble ( n , code )
3991   piton.last_language = lang
3992   piton.join_and_write ( )
3993 end
```

The following function will be used when the key `split-on-empty-lines` is in force. With that key, the computer listing is split in chunks at the empty lines (usually between the abstract functions defined in the computer code). LaTeX will be able to change the page between the chunks. The second argument `n` corresponds to the value of the key `gobble` (number of spaces to gobble).

```
3994 function piton.GobbleSplitParse ( lang , n , splittable , code )
3995   local chunks
3996   chunks =
3997   (
3998     Ct (
3999       (
4000         P " " ^ 0 * "\r"
4001         +
4002         C ( ( ( 1 - P "\r" ) ^ 1 * ( P "\r" + -1 )
4003           - ( P " " ^ 0 * ( P "\r" + -1 ) )
4004           ) ^ 1
4005         )
4006       ) ^ 0
4007     )
4008   ) : match ( piton.Gobble ( n , code ) )
4009   sprintL3 [[ \begingroup ]]
```

```

4010     sprintL3
4011     (
4012         [[ \PitonOptions { split-on-empty-lines = false, gobble = 0, }]]
4013         .. "language = " .. lang .. ","
4014         .. "splittable = " .. splittable .. "}"
4015     )
4016     for k , v in pairs ( chunks ) do
4017         if k > 1 then
4018             sprintL3 ( [[ \l_@@_split_separation_t1 ]] )
4019         end
4020         tex.print
4021         (
4022             [[\begin{]} .. piton.env_used_by_split .. "}\r"
4023             .. v
4024             .. [[\end{]} .. piton.env_used_by_split .. "}\r"
4025         )
4026     end
4027     sprintL3 [[ \endgroup ]]
4028 end

4029 function piton.RetrieveGobbleSplitParse ( lang , n , splittable , code )
4030     local s
4031     s = ( ( P " " ^ 0 * "\r" ) ^ -1 * C ( P ( 1 ) ^ 0 ) * -1 ) : match ( code )
4032     piton.GobbleSplitParse ( lang , n , splittable , s )
4033 end

```

The following Lua string will be inserted between the chunks of code created when the key `split-on-empty-lines` is in force. It's used only once: you have given a name to that Lua string only for legibility. The token list `\l_@@_split_separation_t1` corresponds to the key `split-separation`. That token list must contain elements inserted in *vertical mode* of TeX.

```

4034 piton.string_between_chunks =
4035 [[ \par \l_@@_split_separation_t1 \mode_leave_vertical: ]]
4036 .. [[ \global \g_@@_line_int = 0 ]]

```

The counter `\g_@@_line_int` will be used to control the points where the code may be broken by a change of page (see the key `splittable`).

The following public Lua function is provided to the developer.

```

4037 function piton.get_last_code ( )
4038     return LPEG_cleaner[piton.last_language] : match ( piton.last_code )
4039         : gsub ( '\r\n?' , '\n' )
4040 end

```

### 3.14 To count the number of lines

```

4041 local CountBeamerEnvironments
4042 function CountBeamerEnvironments ( code ) return
4043     (
4044         Ct (
4045             (
4046                 P "\begin{" * beamerEnvironments * ( 1 - P "\r" ) ^ 0 * C "\r"
4047                 +
4048                 ( 1 - P "\r" ) ^ 0 * "\r"
4049             ) ^ 0
4050             * ( 1 - P "\r" ) ^ 0
4051             * -1
4052             ) / table.getn
4053         ) : match ( code )
4054 end

```

The following function counts the lines of `code` except the lines which contains only instructions for the environements of Beamer.

It is used in `GobbleParse` and at the beginning of `\@@_composition`: (in some rare circumstances). Be careful. We have tried a version with `string.gsub` without success.

```

4055 function piton.CountLines ( code )
4056   local count
4057   count =
4058     ( Ct ( ( ( 1 - P "\r" ) ^ 0 * C "\r" ) ^ 0
4059       *
4060       (
4061         space ^ 0 * ( 1 - P "\r" - space ) * ( 1 - P "\r" ) ^ 0 * Cc "\r"
4062         + space ^ 0
4063       ) ^ -1
4064       * -1
4065     ) / table.getn
4066   ) : match ( code )
4067   if piton.beamer then
4068     count = count - 2 * CountBeamerEnvironments ( code )
4069   end
4070   sprintL3 ( [[ \int_gset:Nn \g_@@_nb_lines_int { }] .. count .. "}" )
4071 end

```

The following function is only used once (in `piton.GobbleParse`). We have written an autonomous function only for legibility. The number of lines of the code will be stored in `\l_@@_nb_non_empty_lines_int`. It will be used to compute the largest number of lines to write (when `line-numbers` is in force).

```

4072 function piton.CountNonEmptyLines ( code )
4073   local count = 0

```

The following code is not clear. We should try to replace it by use of the `string` library of Lua.

```

4074   count =
4075     ( Ct ( ( P " " ^ 0 * "\r"
4076           + ( 1 - P "\r" ) ^ 0 * C "\r" ) ^ 0
4077           * ( 1 - P "\r" ) ^ 0
4078           * -1
4079         ) / table.getn
4080       ) : match ( code )
4081   count = count + 1
4082   if piton.beamer then
4083     count = count - 2 * CountBeamerEnvironments ( code )
4084   end
4085   sprintL3
4086   ( [[ \int_set:Nn \l_@@_nb_non_empty_lines_int { }] .. count .. "}" )
4087 end

```

The following function stores in `\l_@@_first_line_int` and `\l_@@_last_line_int` the numbers of lines of the file `file_name` corresponding to the strings `marker_beginning` and `marker_end`. `s` is the marker of the beginning and `t` is the marker of the end.

```

4088 function piton.ComputeRange ( s , t , file_name )
4089   local first_line = -1
4090   local count = 0
4091   local last_found = false
4092   for line in io.lines ( file_name ) do
4093     if first_line == -1 then
4094       if line : sub ( 1 , #s ) == s then
4095         first_line = count
4096       end
4097     else
4098       if line : sub ( 1 , #t ) == t then
4099         last_found = true
4100         break
4101       end
4102     end
4103     count = count + 1
4104   end

```

```

4105   if first_line == -1 then
4106     sprintL3 [[ \@@_error_or_warning:n { begin-marker-not-found } ]]
4107   else
4108     if not last_found then
4109       sprintL3 [[ \@@_error_or_warning:n { end-marker-not-found } ]]
4110     end
4111   end
4112   sprintL3 (
4113     [[ \int_set:Nn \l_@@_first_line_int { } ] .. first_line .. ' + 2 ']
4114     .. [[ \global \l_@@_last_line_int = ]] .. count )
4115 end

```

### 3.15 To determine the empty lines of the listings

Despite its name, the Lua function `ComputeLinesStatus` computes `piton.lines_status` but also `piton.empty_lines`.

In `piton.empty_lines`, a line will have the number 0 if it's a empty line (in fact a blank line, with only spaces) and 1 elsewhere.

In `piton.lines_status`, each line will have a status with regard the breaking points allowed (for the changes of pages).

- 0 if the line is empty and a page break is allowed;
- 1 if the line is not empty but a page break is allowed after that line;
- 2 if a page break is *not* allowed after that line (empty or not empty).

`splittable` is the value of `\l_@@_splittable_int`. However, if `splittable-on-empty-lines` is in force, `splittable` is the opposite of `\l_@@_splittable_int`.

```
4116 function piton.ComputeLinesStatus ( code , splittable )
```

The lines in the listings which correspond to the beginning or the end of an environment of Beamer (eg. `\begin{uncoverenv}`) must be retrieved (those lines have *no* number and therefore, *no* status).

```

4117   local lpeg_line_beamer
4118   if piton.beamer then
4119     lpeg_line_beamer =
4120       space ^ 0
4121       * P [[\begin{}]] * beamerEnvironments * "}"
4122       * ( "<" * ( 1 - P ">" ) ^ 0 * ">" ) ^ -1
4123       +
4124       space ^ 0
4125       * P [[\end{}]] * beamerEnvironments * "}"
4126   else
4127     lpeg_line_beamer = P ( false )
4128   end
4129
4130   local lpeg_empty_lines =
4131   Ct (
4132     ( lpeg_line_beamer * "\r"
4133       +
4134       P " " ^ 0 * "\r" * Cc ( 0 )
4135       +
4136       ( 1 - P "\r" ) ^ 0 * "\r" * Cc ( 1 )
4137       ) ^ 0
4138       *
4139       ( lpeg_line_beamer + ( 1 - P "\r" ) ^ 1 * Cc ( 1 ) ) ^ -1
4140   )
4141   *
4142   local lpeg_all_lines =
4143   Ct (
4144     ( lpeg_line_beamer * "\r"

```

```

4145      ( 1 - P "\r" ) ^ 0 * "\r" * Cc ( 1 )
4146      ) ^ 0
4147      *
4148      ( lpeg_line_beamer + ( 1 - P "\r" ) ^ 1 * Cc ( 1 ) ) ^ -1
4149      )
4150      * -1

```

We begin with the computation of `piton.empty_lines`. It will be used in conjunction with `line-numbers`.

```
4151 piton.empty_lines = lpeg_empty_lines : match ( code )
```

Now, we compute `piton.lines_status`. It will be used in conjunction with `splittable` and `splittable-on-empty-lines`.

Now, we will take into account the current value of `\l_@@_splittable_int` (provided by the *absolute value* of the argument `splittable`).

```

4152 local lines_status
4153 local s = splittable
4154 if splittable < 0 then s = - splittable end
4155 if splittable > 0 then
4156   lines_status = lpeg_all_lines : match ( code )
4157 else

```

Here, we should try to copy `piton.empty_lines` but it's not easy.

```

4158 lines_status = lpeg_empty_lines : match ( code )
4159 for i , x in ipairs ( lines_status ) do
4160   if x == 0 then
4161     for j = 1 , s - 1 do
4162       if i + j > #lines_status then break end
4163       if lines_status[i+j] == 0 then break end
4164       lines_status[i+j] = 2
4165   end
4166   for j = 1 , s - 1 do
4167     if i - j == 1 then break end
4168     if lines_status[i-j-1] == 0 then break end
4169     lines_status[i-j-1] = 2
4170   end
4171 end
4172 end
4173 end

```

In all cases (whatever is the value of `splittable-on-empty-lines`) we have to deal with both extremities of the listing to format.

First from the beginning of the code.

```

4174 for j = 1 , s - 1 do
4175   if j > #lines_status then break end
4176   if lines_status[j] == 0 then break end
4177   lines_status[j] = 2
4178 end

```

Now, from the end of the code.

```

4179 for j = 1 , s - 1 do
4180   if #lines_status - j == 0 then break end
4181   if lines_status[#lines_status - j] == 0 then break end
4182   lines_status[#lines_status - j] = 2
4183 end

4184 piton.lines_status = lines_status
4185 end

4186 function piton.TranslateBeamerEnv ( code )
4187   local s
4188   s =
4189   (
4190     Ct (

```

```

4191      (
4192          space ^ 0
4193          * C (
4194              ( P "\begin{" + "\end{"
4195                  * beamerEnvironments * "}" * ( 1 - P "\r" ) ^ 0 * "\r"
4196                  )
4197                  + C ( ( 1 - P "\r" ) ^ 0 * "\r" )
4198          ) ^ 0
4199          *
4200          (
4201              (
4202                  space ^ 0
4203                  * C (
4204                      ( P "\begin{" + "\end{"
4205                          * beamerEnvironments * "}" * ( 1 - P "\r" ) ^ 0 * -1
4206                          )
4207                          + C ( ( 1 - P "\r" ) ^ 1 ) * -1
4208                  ) ^ -1
4209              )
4210          ) ^ -1 / table.concat
4211      ) : match ( code )
4212      sprintL3 ( [[ \tl_set:Nn \l_@@_listing_tl { } ] ] )
4213      tex.sprint ( luatexbase.catcodetables.other , s )
4214      sprintL3 ( "}" )
4215 end

```

### 3.16 To create new languages with the syntax of listings

```

4216 function piton.new_language ( lang , definition )
4217     lang = lang : lower ( )

4218     local alpha , digit = lpeg.alpha , lpeg.digit
4219     local extra_letters = { "@" , "_" , "$" } --

```

The command `add_to_letter` (triggered by the key `)`) don't write right away in the LPEG pattern of the letters in an intermediate `extra_letters` because we may have to retrieve letters from that "list" if there appear in a key `alsoother`.

```

4220     function add_to_letter ( c )
4221         if c ~= " " then table.insert ( extra_letters , c ) end
4222     end

```

For the digits, it's straightforward.

```

4223     function add_to_digit ( c )
4224         if c ~= " " then digit = digit + c end
4225     end

```

The main use of the key `alsoother` is, for the language LaTeX, when you have to retrieve some characters from the list of letters, in particular `@` and `_` (which, by default, are not allowed in the name of a control sequence in TeX).

(In the following LPEG we have a problem when we try to add `{` and `}`).

```

4226     local other = S ":_@+*!/?;.:()[]~^=#!&\"\\\$" --
4227     local extra_others = { }
4228     function add_to_other ( c )
4229         if c ~= " " then

```

We will use `extra_others` to retrieve further these characters from the list of the letters.

```

4230         extra_others[c] = true

```

The LPEG pattern `other` will be used in conjunction with the key `tag` (mainly for languages such as HTML and XML) for the character `/` in the closing tags `</....>`.

```

4231         other = other + P ( c )

```

```

4232     end
4233 end

```

Now, the first transformation of the definition of the language, as provided by the end user in the argument `definition` of `piton.new_language`.

```

4234 local def_table
4235 if ( S ", " ^ 0 * -1 ) : match ( definition ) then
4236   def_table = {}
4237 else
4238   local strict_braces =
4239     P { "E" ,
4240       E = ( "{" * V "F" * "}" + ( 1 - S ",{}" ) ) ^ 0 ,
4241       F = ( "{" * V "F" * "}" + ( 1 - S "{}" ) ) ^ 0
4242     }
4243   local cut_definition =
4244     P { "E" ,
4245       E = Ct ( V "F" * ( "," * V "F" ) ^ 0 ) ,
4246       F = Ct ( space ^ 0 * C ( alpha ^ 1 ) * space ^ 0
4247                 * ( "=" * space ^ 0 * C ( strict_braces ) ) ^ -1 )
4248     }
4249   def_table = cut_definition : match ( definition )
4250 end

```

The definition of the language, provided by the end user of `piton` is now in the Lua table `def_table`. We will use it *several times*.

The following LPEG will be used to extract arguments in the values of the keys (`morekeywords`, `morecomment`, `morestring`, etc.).

```

4251 local tex_braced_arg = "{" * C ( ( 1 - P "]" ) ^ 0 ) * "}"
4252 local tex_arg = tex_braced_arg + C ( 1 )
4253 local tex_option_arg = "[" * C ( ( 1 - P "]" ) ^ 0 ) * "]" + Cc ( nil )
4254 local args_for_tag
4255   = tex_option_arg
4256   * space ^ 0
4257   * tex_arg
4258   * space ^ 0
4259   * tex_arg
4260 local args_for_morekeywords
4261   = "[" * C ( ( 1 - P "]" ) ^ 0 ) * "]"
4262   * space ^ 0
4263   * tex_option_arg
4264   * space ^ 0
4265   * tex_arg
4266   * space ^ 0
4267   * ( tex_braced_arg + Cc ( nil ) )
4268 local args_for_moredelims
4269   = ( C ( P "*" ^ -2 ) + Cc ( nil ) ) * space ^ 0
4270   * args_for_morekeywords
4271 local args_for_morecomment
4272   = "[" * C ( ( 1 - P "]" ) ^ 0 ) * "]"
4273   * space ^ 0
4274   * tex_option_arg
4275   * space ^ 0
4276   * C ( P ( 1 ) ^ 0 * -1 )

```

We scan the definition of the language (i.e. the table `def_table`) in order to detect the potential key `sensitive`. Indeed, we have to catch that key before the treatment of the keywords of the language. We will also look for the potential keys `alsodigit`, `alsoletter` and `tag`.

```

4277 local sensitive = true
4278 local style_tag , left_tag , right_tag
4279 for _ , x in ipairs ( def_table ) do
4280   if x[1] == "sensitive" then

```

```

4281     if x[2] == nil or ( P "true" ) : match ( x[2] ) then
4282         sensitive = true
4283     else
4284         if ( P "false" + P "f" ) : match ( x[2] ) then sensitive = false end
4285     end
4286   end
4287   if x[1] == "alsodigit" then x[2] : gsub ( ".", add_to_digit ) end
4288   if x[1] == "alsoletter" then x[2] : gsub ( ".", add_to_letter ) end
4289   if x[1] == "alsoother" then x[2] : gsub ( ".", add_to_other ) end
4290   if x[1] == "tag" then
4291     style_tag , left_tag , right_tag = args_for_tag : match ( x[2] )
4292     style_tag = style_tag or [PitonStyle{Tag}]
4293   end
4294 end

```

Now, the LPEG for the numbers. Of course, it uses `digit` previously computed.

```

4295 local Number =
4296   K ( 'Number.Internal' ,
4297     ( digit ^ 1 * "." * # ( 1 - P "." ) * digit ^ 0
4298       + digit ^ 0 * "." * digit ^ 1
4299       + digit ^ 1 )
4300     * ( S "eE" * S "+-" ^ -1 * digit ^ 1 ) ^ -1
4301     + digit ^ 1
4302   )
4303 local string_extra_letters = ""
4304 for _ , x in ipairs ( extra_letters ) do
4305   if not ( extra_others[x] ) then
4306     string_extra_letters = string_extra_letters .. x
4307   end
4308 end
4309 local letter = alpha + S ( string_extra_letters )
4310   + P "â" + "â" + "ç" + "é" + "è" + "ê" + "ë" + "î"
4311   + "ô" + "û" + "ü" + "Ã" + "Ã" + "Ç" + "Ê" + "È" + "È" + "È"
4312   + "Í" + "Í" + "Ó" + "Ó" + "Ü"
4313 local alphanum = letter + digit
4314 local identifier = letter * alphanum ^ 0
4315 local Identifier = K ( 'Identifier.Internal' , identifier )

```

Now, we scan the definition of the language (i.e. the table `def_table`) for the keywords.

The following LPEG does *not* catch the optional argument between square brackets in first position.

```

4316 local split_clist =
4317   P { "E" ,
4318     E = ( "[" * ( 1 - P "]" ) ^ 0 * "]" ) ^ -1
4319     * ( P "{" ) ^ 1
4320     * Ct ( V "F" * ( "," * V "F" ) ^ 0 )
4321     * ( P "}" ) ^ 1 * space ^ 0 ,
4322     F = space ^ 0 * C ( letter * alphanum ^ 0 + other ^ 1 ) * space ^ 0
4323   }

```

The following function will be used if the keywords are not case-sensitive.

```

4324 local keyword_to_lpeg
4325 function keyword_to_lpeg ( name ) return
4326   Q ( Cmt (
4327     C ( identifier ) ,
4328     function ( _ , _ , a ) return a : upper ( ) == name : upper ( )
4329     end
4330   )
4331 )
4332 end
4333 local Keyword = P ( false )
4334 local PrefixedKeyword = P ( false )

```

Now, we actually treat all the keywords and also the key `moredirectives`.

```

4335   for _ , x in ipairs ( def_table )

```

```

4336 do if x[1] == "morekeywords"
4337   or x[1] == "otherkeywords"
4338   or x[1] == "moredirectives"
4339   or x[1] == "moretexcs"
4340   then
4341     local keywords = P ( false )
4342     local style = [[\PitonStyle{Keyword}]]
4343     if x[1] == "moredirectives" then style = [[\PitonStyle{Directive}]] end
4344     style = tex_option_arg : match ( x[2] ) or style
4345     local n = tonumber ( style )
4346     if n then
4347       if n > 1 then style = [[\PitonStyle{Keyword}]] .. style .. "}" end
4348     end
4349     for _ , word in ipairs ( split_clist : match ( x[2] ) ) do
4350       if x[1] == "moretexcs" then
4351         keywords = Q ( [[\]] .. word ) + keywords
4352       else
4353         if sensitive

```

The documentation of `lstdlistings` specifies that, for the key `morekeywords`, if a keyword is a prefix of another keyword, then the prefix must appear first. However, for the lpeg, it's rather the contrary. That's why, here, we add the new element *on the left*.

```

4354   then keywords = Q ( word ) + keywords
4355   else keywords = keyword_to_lpeg ( word ) + keywords
4356   end
4357   end
4358 end
4359 Keyword = Keyword +
4360   Lc ( "{" .. style .. "{" ) * keywords * Lc "}"
4361 end

```

Of course, the feature with the key `keywordsprefix` is designed for the languages TeX, LaTeX, et al. In that case, there is two kinds of keywords (= control sequences).

- those beginning with \ and a sequence of characters of catcode “letter”;
- those beginning by \ followed by one character of catcode “other”.

The following code addresses both cases. Of course, the LPEG pattern `letter` must catch only characters of catcode “letter”. That's why we have a key `alsoletter` to add new characters in that category (e.g. : when we want to format L3 code). However, the LPEG pattern is allowed to catch *more* than only the characters of catcode “other” in TeX.

```

4362 if x[1] == "keywordsprefix" then
4363   local prefix = ( ( C ( 1 - P " " ) ^ 1 ) * P " " ^ 0 ) : match ( x[2] )
4364   PrefixKeyword = PrefixKeyword
4365   + K ( 'Keyword' , P ( prefix ) * ( letter ^ 1 + other ) )
4366 end
4367 end

```

Now, we scan the definition of the language (i.e. the table `def_table`) for the strings.

```

4368 local long_string = P ( false )
4369 local Long_string = P ( false )
4370 local LongString = P ( false )
4371 local central_pattern = P ( false )
4372 for _ , x in ipairs ( def_table ) do
4373   if x[1] == "morestring" then
4374     arg1 , arg2 , arg3 , arg4 = args_for_morekeywords : match ( x[2] )
4375     arg2 = arg2 or [[\PitonStyle{String.Long}]]
4376     if arg1 ~= "s" then
4377       arg4 = arg3
4378     end
4379     central_pattern = 1 - S ( " \r" .. arg4 )
4380     if arg1 : match "b" then
4381       central_pattern = P ( [[\]] .. arg3 ) + central_pattern
4382     end

```

In fact, the specifier `d` is point-less: when it is not in force, it's still possible to double the delimiter with a correct behaviour of piton since, in that case, piton will compose *two* contiguous strings...

```

4383     if arg1 : match "d" or arg1 == "m" then
4384         central_pattern = P ( arg3 .. arg3 ) + central_pattern
4385     end
4386     if arg1 == "m"
4387     then prefix = B ( 1 - letter - ")" - "]" )
4388     else prefix = P ( true )
4389     end

```

First, a pattern *without captures* (needed to compute braces).

```

4390     long_string = long_string +
4391         prefix
4392         * arg3
4393         * ( space + central_pattern ) ^ 0
4394         * arg4

```

Now a pattern *with captures*.

```

4395     local pattern =
4396         prefix
4397         * Q ( arg3 )
4398         * ( SpaceInString + Q ( central_pattern ^ 1 ) + EOL ) ^ 0
4399         * Q ( arg4 )

```

We will need `Long_string` in the nested comments.

```

4400     Long_string = Long_string + pattern
4401     LongString = LongString +
4402         Ct ( Cc "Open" * Cc ( "{" .. arg2 .. "}" ) * Cc "}" )
4403         * pattern
4404         * Ct ( Cc "Close" )
4405     end
4406 end

```

The argument of `Compute_braces` must be a pattern *which does no catching* corresponding to the strings of the language.

```

4407     local braces = Compute_braces ( long_string )
4408     if piton.beamer then Beamer = Compute_Beamer ( lang , braces ) end
4409
4410     DetectedCommands =
4411         Compute_DetectedCommands ( lang , braces )
4412         + Compute_RawDetectedCommands ( lang , braces )
4413
4414     LPEG_cleaner[lang] = Compute_LPEG_cleaner ( lang , braces )

```

Now, we deal with the comments and the delims.

```

4415     local CommentDelim = P ( false )
4416
4417     for _ , x in ipairs ( def_table ) do
4418         if x[1] == "morecomment" then
4419             local arg1 , arg2 , other_args = args_for_morecomment : match ( x[2] )
4420             arg2 = arg2 or {[PitonStyle{Comment}]}

```

If the letter `i` is present in the first argument (eg: `morecomment = [si]{(*){}}`, then the corresponding comments are discarded.

```

4421     if arg1 : match "i" then arg2 = {[PitonStyle{Discard}]} end
4422     if arg1 : match "l" then
4423         local arg3 = ( tex_braced_arg + C ( P ( 1 ) ^ 0 * -1 ) )
4424             : match ( other_args )
4425         if arg3 == {[#]} then arg3 = "#" end -- mandatory
4426         if arg3 == {[%]} then arg3 = "%" end -- mandatory
4427         CommentDelim = CommentDelim +
4428             Ct ( Cc "Open"
4429                 * Cc ( "{" .. arg2 .. "}" ) * Cc "}" )
4430                 * Q ( arg3 )

```

```

4431           * ( CommentMath + Q ( ( 1 - S "$\r" ) ^ 1 ) ) ^ 0 -- $
4432           * Ct ( Cc "Close" )
4433           * ( EOL + -1 )
4434     else
4435       local arg3 , arg4 =
4436         ( tex_arg * space ^ 0 * tex_arg ) : match ( other_args )
4437       if arg1 : match "s" then
4438         CommentDelim = CommentDelim +
